I am not sure -- outside of the code tests -- that the exams are any easier.
What is different is the resources available to prepare for them -- so
damned much better. There is simply no excuse for blaming a claque of
losers for one's own inertia. You want it or you don't and it ain't that
hard to get.

1719. 100Watt to 1400watt HF80-10M Amplifiers SALE!

Newsgroup: rec.radio.cb
Date: 2000-12-11 11:02:19 UTC
From: Justin DePolis <justinde@pacbell.net>
Message-ID: <yv2Z5.48711$Wq1.18879384@nnrp5-w.sbc.net>
Source record: 63103

Hello, I have alot of 80-10 meter amplifiers for sale, after the closing of
a retail outlet, below is a price list:

Mobile Units: (these units require about 30 watts drive, have selectable
power output, and have a 20DB receive pre-amplifier)

KLV 100 watt unit: $89.99
Mirage 300 watt unit: $175.00
Mirage 300 watt unit with thermal protection: $ 225.00

The units below all have thermal protection, and SWR protection:

Mirage 600 watt: $399.99
Mirage 800 watt: $435.99
Mirage 1200 watt: $799.99

Base Models: (all base units 110 volts)

Tube Type: (these units use the 811-A, or EL-519)

KLV 200 watt: $234.99
KLV 400 watt: $434.99
KLV 1200 watt:$699.99

Solid State:

Mirage 300 watt: $599.99
Mirage 500 watt: $699.99

My name is Justin, and I can be contacted at (909) 279-4193,
or at: justinde@pacbell.net
You can also check out my web site for more information:
http://www.geocities.com/ham2way2000/index.html
Quantity pricing available, and prices can be negotiable, thanks, and 73's.
(attached to the post is a picture of the base units)

Gary,

Thank you for your wise words. The "illegals-only" group has done a great service to rec.radio.cb by bailing out. Safe in their own little clubhouse they can discuss things like the pleasures of squashing other cb users with amplifiers...or how the law doesn't apply to them....and how unfair it is that they can't transmit anywhere they want without a license.

Bradley,

No need to get huffy. I'm just saying I *heard* that DaveMade, X-Force, Skullcracka, TrainBuilt, NoName (and all the rest) are next on Riley Hollingsworth's hit list. Probably because concerned people (like me) wrote letters and complained to the FCC about the proliferation of illegal high powered amplifiers messing up their consumer devices. It's similar to the recent grassroots public outcry responsible for getting HR2346 passed. Surely you don't want these illegal devices to be openly sold and marketed to CBers, do you? And I do agree that no one should hide behind false identities. DaveMade, X-Force, Skullcracka, TrainBuilt, NoName need to come out and tell us their real names and addresses.

Well said and a good attitude. Cbers can do what hams do to find a
trouble station. DF them and report them. Legal CBers CAN help to
clean up 11m, but will they DO IT? Time will tell....

I hear ya' Jerry! I usually get through Charlotte a couple of times a year. Used to stay at Carowinds campground until they updated and modernized (read:ruined) it. Now I take it all the way to Mt. Airy before stopping. Not going north this year for the holidays, but a spring venture is in the works, probably around May. I'll let ya' know, maybe we can tag on the air as I crawl through that infamous Charlotte traffic.

Actually Fred, YOUR ignorance is showing. The "F" word was indeed brought to us by the proper vernacular of English.

Fuck (fuk) 1) To have sexual intercourse with.
2) Slang. to treat unfairly or harshly.
3)Slang. to meddle
4)Fuck around, slang. A) To behave in a frivolous or meddlesome way. B) To engage in promiscuous sex.
5) fuck off, slang. A) to shirk one's ability; malinger. B) GO AWAY:used as an exclamation. C) Waste time.
6) waste time.
7) fuck up, slang. A) to bungle or botch; ruin. B) To act stupidly or carelessly; cause trouble; mess up-interj.

So, looks like it applies quite appropriately.

You're quite welcome!

That would be great if it became a revenue enhancer. Then the 'pile can get even louder, since radio generated revenue won't hold a pimple to the revenue generated from the drug busts in the Port-of-Miami, it wil be enforced about as much as jaywalking. Maybe after the new year it will be time to pump the mobile up a bit more...maybe a baby driver...maybe an 8 pill....

> the disciplinary rate of hams vs. cbers in any given year.

I simply asked you where you got the number from. I guess it did not come from the FCC otherwise you would have stated so directly. So I am still wondering where did that number come from? I am not saying anybody is wrong, but I would like to know the source of your information.

> It is probably greater than that. They go after cbers in the future, it
may change.
> I realize this is hard for you, but pay attention..real close.. I never
> said I was willing to pay any damn fine. If I choose to operate
> illegally, then I am taking the chance. By taking the chance, I would
> therefore agree to a fine if I should get popped for such an act. If you
> can't do the time....and the law pertaining to cb is taken just as
> likely as the speed limits..a gamble of sorts. IF I choose to operate.

I see that at least you had the idea of a fine cross your mine. I wonder how many others on this news group, who operate in an illegal manner, have thought about it? I really think many on this news group think they are playing a game with the FCC by ignoring the parameters under which the 11m band is to operate.

> I'm not one of these guys (but you probably are) who tries and talks his
> way out of a speeding ticket. You pull me over, I sign my ticket and go
> on my way. If you can't distinguish between the lines, move on.
> Secondly, everything you said about other bands, now sit up pay
> attention again, I DON"T CARE!

You really should care. The point being that even Hams have had their bands moved, or eliminated. Assuming that can't happen to the 11m band is foolish. Where did you think the 11m band came from in the first place? The FCC has created the FRS service, and now the MURS service. The FCC left the door open to expanding the MURS channels past the current 5. Also the original intention was to create a V/UHF CB Radio service, not a H.F. based one. At some point the FCC "may" remove the 11m band from CB Radio use. I see the moves by the FCC as the writing on the wall where someday the 11m CB radio band will be allocated to other uses. You have to admit that 11m no longer serves the original intention of providing a short range communication system for the general public for both private, and business uses. It has turned in to a "Hobby Radio" band. This is a situation that make little sense since that is one of the reasons the Amateur Radio Service exists. Sooner or later the FCC is going to correct that, so the real question is

not IF, but WHEN that will happen.

> They have no bearing in my life unless I
> am just scanning broad spectrum on auto. for whatever happens to come
> up. I don't waste my time, for you it may not be, for me, it don't apply
> so what you said got chucked in the outhouse.

Like I said above the 11m band "could" someday end up "chucked in the outhouse" too.

> Thirdly, the wind has what? The only storm heading your way Leland is
> the booming thunder and crackling amps dropping the maul on you when you
> get out on the cb band preaching!

I did the same thing some time back, about cell phone use, and the movement to out law their use mobile too. I got flamed for that, and just like ere - Oh no, that is NEVER going to happen. Well guess what? It did! Little by little, city by city, laws are popping up to pop people using cell phones while driving. The people that thought I was dumb no longer think my views had no merit. Now they are pissed because they did not see it coming in time to do anything about it. Well myself, and a few others, did bring up the issue, but nobody wanted to believe it could happen, oh well.

So lets look at things again, FRS, now MURS, and finaly your Good-Buddy Bill in the White House signed that CB radio enforcement bill in to law. That game is being played, and the ball is in motion. And most CBers don't have a clue about what is going on.

> Fourth, I don't speak for the group, just myself.
> Fifth, I didn't ask for more spectrum. This has what to do with the
> topic?

CBer's cried for a long time, and got the channels expanded from 23 to 40 in case you forgot about that. Some would like to see that expanded again. So the issue of additional spectrum is a real issue for CBers too.

> And lastly, since you continue to refer to trolls to clarify, validate,
> lend credibility, and back up your position, it speaks for itself.

What I read here is you are uncomfortable with the idea that the FCC does more than send a warning letter to CBers violating the Part 95 rules. Your statement above is for your benefit, not mine. I know the FCC is not playing games with rule violators. You can dismiss the cases posted by N8 anyway you like, but those CBers paid real fines, and got what was coming to them. Denying that does not put those $7000 fines back in their wallets I can assure you.

All of these amps are legally manufactured amateur amplifiers and it is painfully obvious there are apparently many amateurs on this NG which would create a viable venue for the sale of these items. One can advertise anything anywhere one wants too. The last time I checked Aaron there was still an American flag flying over the White House so go try your intimidation tactics elsewhere because no one here is really frightened by you or your RHollingsworth email address threats.

And who did you here this from, some blue-hair on 80 meters who spewed this information forth in between complaining about his flaming hemorrhoid and gout conditions?

Hey Aaron, I hear that the 70 cm. band, a large portion of the 40 meter band and morse code is going to go poof the next time the WARC meets in 2002.

I think you as an amateur radio enthusiast have much greater problems than Xforce, Davemade and the like. Dont waste your time emailing Riley et als becuase they know all about it, and they still choose to do nothing because there arent many complaints from the general public.....the only complaints are coming from fat ass hams who think they are Radio Rambos'.

Glad you specified "certain hamsters". I might add VERY FEW. A lot of us
1) Came from 11 meters
2) Used to be freebanders (Before you folks figured out how to get MORE
channels from
a Uniden Upd858)
3) Support those asking questions that really want to learn.

We "hamsters" also have freedom of operation within the limits of the rules and regulations. I shoot skip, I run over a KW. I have PLENTY of frequency space. Especially the ability to go to other bands when 10 and 11 meters aren't doing so well.

I am NOT a pimp for "da man". I was a member of the ARRL, but decided almost twenty years ago that they did not do service to those whom thought they did.

As to illegal activities, those that do them assume the risks involved. If you don't splatter all over my receiver - I won't bother you. If you do - I'll try and come talk to you and show you how to clean up the signal. If I can help you learn - I've started you in the direction that you may wish to follow.

Cheers!

These people have to pull in to weight stations on the highway. You ask these guys and they will tell you all about the "safety" inspections they go through. Now
the local cop at the weight station can check the driver's radio equipment too.

This is going to be interesting. The cop already has them "pulled over" so to speak, and the "probable cause" is the law that requires them to pull in to an open weight station. Once there they can go over it with a fine tooth comb. So if they "discover" the amplifier while doing a safety inspection, too bad for the truck driver it seems. This is no different than a cop pulling somebody over for some BS reason, then searching the vehicle, and then "discovering" contraband. It happens all the time, and if you check the law the LEO's don't need a search warrant either. The jails are full of people that get busted like this every day, so if it can't be done, then why are they in jail?

Aaron - First go and get you license. Second learn the laws and rules. If I have amps previously manufactured with 10 meters included - I can sell them. Where he chooses to advertise them doesn't matter.

New made amps with 10 meters included CAN be sold with the caveat that they ARE supposed to be for export.

Send this to rholling@fcc.gov if that is what you want.

N0DGN (General - Going to Extra already can do 35WPM)

Hi,

Hmm, so the only difference between a shitty HAM and a real HAM is the fact that you know how to do beep-beep ? Maybe we should introduce an exam on computers and software to gain access on VHF/UHF as well (otherwise we would get those shitty beep-beep HAMs that think a wire between two trees is an antenna their as well) ?

Isn't this crazy ? Personally I have full respect for people who study this mode, but I don't see NO reason at all why it is used to give exclusive access to decameter bands.

Just get rid of the requirement for CW (and the corresponding license class) on certain segments (the current non-CW segments on HF - and they shouldn't shrink), and keep those CW-segments exclusive for those people that still want to do the exam (that way the different license classes can remain the same as well).

Is this so hard in our HAM world ?

Hey pal, I don't freeband, so stop accusing me of that. I have gotten on channel 19 and told the truckers to stay out of 10 meters. I felt like Boobner, pounding my head against the wall. Accuse. lie, slander, whatever. When you catch me on an illegal frequency, then you can say something. You, like the trolling hams (and wannabe hams), think that all CB'ers use extra channels. Where's your proof? The bigger problem is the homeys in the inner city that run way too much in their mobiles on legal channels. Since the purpose of the new law is to go after interfering operators, I needn't worry. Go think up some new flame bait.

Technician class operators are at the bottom rung of the amateur license scale and they most likely have some radio roots to CB in the past. Why is it that every couple of years some of these Techs are compelled to come to this NG and attempt to enforce some law by starting an ill conceived enforcement campaign?

Wouldnt their time be better spent learning more about amateur radio and accelling up their own license classes?

If you search the past NG posting's you''ll find that 90% of the CB NG flamers are Technician class license holders. Its painfully obvious that the higher class license holders dont consider CB amps a great threat because they either dont care or they dont have the time. What does this tell you?

Others in this NG have already done that. He claims not to be concerned about it, and has even offered to set an extra plate at the table.
The result there was that N8WWM was threatened with being shot, and his wife and child raped. This was a few days ago.

I think he is asinine, sometimes funny, and a pest. BUT I agree with one thing he said: Threats of violence are way over the line.
That kind of thing will also get you in FEDERAL trouble bigtime. A guy got killed as a result of a flame war on here a few years ago. They take that stuff very seriously.

You have a Jekyll/Hyde persona. One day you post in condescension, I return with such, and you return to the merits. OK. This is a simple way to teach you something again, Leland. Numbers and statistics can be construed or manipulated any way you want, sort of like your view of more than 4 watts, freebanders and "criminals". Take the total number of actions taken by the FCC last year. Take away the commercial FM stations, pirate radio stations, companies whose licensing for their 2 way business radios has expired, manufacturers, etc., etc., and then total the number of individuals ONLY. Then, subtract the hammies. What you are left with is representational of cbers that had action taken against them, and for informational purposes, a ratio can be deduced from the above. I'll confess, I didn't use the entire year, I used the month of December and multiplied that figure times twelve. If you are asking me for a link, do your own homework. Let me know what figure you arrive at.

Your hammie bands are in way more danger, due to spectrum auctions and other miscellaneous obstructions, of getting the ax, long before 11 meter is going anywhere. The writing has been on the wall since the seventies, only now it is covered with graffiti.

Cell phone analogy? Ok! Walking and chewing gum. Some can, some can't. Since some people are incapable of driving and talking, lets ban it for everyone. Theres that Jeckyll/Hyde thing again..or am I mistaken? Was your position on the cell phone law banning them pro or con?

FRS and MURS, already good mods and power exceeding legal limits. They gave us more freqs to play with and you're pissed over it, which is why you even brought it up, attempting to create a tie-in somehow with the new regulations passed. The only tie-in that may exist is they probably gave us those to alleviate the 11 meter band a bit. Hell, at least they are attempting to HELP us!

I'm not uncomfortable with anything, Leland. I can't dismiss anything by the troll you refer, 'cause I CAN'T SEE IT! But I can dismiss your posts when you attempt to use a chainsaw to vasectomize yourself by referring to it. I saw enough to know that anyone that aligns himself with it is a troll, no matter what it posts now. It's credibility, as yours will probably soon be, is shot, even if it may happen to be correct (which it never was).

They aren't locals at the weigh stations, Leland. They are DOT, State and once in a while, County. The law yields power to local jurisdictions. Think a State trooper is gonna call the local boys to check out the big bad truckers cb? Think again!

It tells me that the real hammies don't accept the techie class, either. They aren't accepted by what they thought, so they take out their inadequacies and shortcomings by returning to their roots, that somehow, in their mentally capacitance challenged lives, lends their malnourished egos a temporary fix for what ails 'em! My apologies to the new techs out there that conduct themselves with respect.

1784. Why N8WWM is like a deadkeyer

Newsgroup: rec.radio.cb
Date: 2000-12-11 19:27:48 UTC
From: ch15a@aol.com
Message-ID: <20001211142748.26571.00004214@ng-fu1.aol.com>
Source record: 63165

N8wwwm is like a deadkeyer because:

Each time you let him know that you are paying attention to what he says, he just is encouraged to say more.

The easiest way to make him go away is to refuse to acknowledge that you even know he is posting/transmitting.

Deadkeyers are usually juvenile newbies who have personality problems and can't get notice from people in normal ways.

Why do you care what a ham-ster thinks anyways. Who died and made him King of the newsgroup?

1785. Re: Why is it that Tech's are the biggest complainers about CB amps?

Newsgroup: rec.radio.cb

I agree Head , He got tired of getting his lipstick Smeared, on 11meters. He then went and got his " tech pass", once he went to 2meters, he could'nt fit in there either, because the other (and not every ham operator is this way) ham would not give him the time of the day too. So where does that leave him? rec.radio.cb harassing people, that he would not be able to, unless it's done sitting at a keyboard!! MR.PAIN&#65533;

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connector as well. Requires 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out.

Asking only $ 45.00 (US$) INCLUDING shipping from Canada
Great deal ! ! !!
A Picture can be e-mailed.

>day too. So where does that leave him? rec.radio.cb harassing people,
>that he would not be able to, unless it's done sitting at a keyboard!!
>MR.PAINï¿½<--That little R means he is a registered moron.

Hey Mr. Plain...
Call me what you want, say what you want...All you are doing is proving my point. Only the illegal guys like you and your wives here are the ones upset by the laws. I am NOT complaining. I am laughing at your pathetic antics.
By the way...I am a good op on the air. I would never pollute the radio the way geeks like you do. You and your kind are criminals.

> you or your RHollingsworth email address threats.

Steve,

Are you threatened by my posting Hollingsworth's email address?

Please don't be.

Of course this guy is free to advertise his illegal amps in the CB
newsgroup.

But who is kidding who?

We don't have to play that game where we pretend that 10 meter-enabled
HF amps designed for DC operation and advertised (heavily) in a CB
newsgroup are perfectly innocent ham gear, do we, Steve?

You know, Steve as well as I do that this guy is a businessman (not
unlike yourself) who derives needed INCOME from selling illegal goods to
CBers. When confronted with that fact, he denies it, of course.

Just like all criminals and black marketeers delude themselves that what
they're doing is just trying to make a living.

No! The intent was to INFORM! This is a ng and you are trying to turn it into a circle jerk competition between you and a few other bottom feeders. A ng INFORMS. THIS is a threat; "If I ever am fortunate enough to meet one of you circle jerks, say, oh, I don't know, at DAYTON, I WILL educate y'all with some good 'ole southern hospitality". Can you now distinguish the difference between the EXAMPLES I gave? For extra credit, go back and read the post about the proper useage of the "F" word and how it is applied in proper vernacular. Apply it. English lesson over!

Pass it along? Whatever floats your boat. But instead, you may want to c'mon down and chew on some gator tail, or vice-versa. The invite stands!

Okay. I know what you're thinking. Aaron's just beating a dead horse here. But honestly, take a look at this post - from a Mr. "Pain", (I assume his CB transmissions cause others pain and he's proud of it?). Anyway, take a quick read through:

Mr. Pain mrpain@keydowns.com wrote:
<<What you don't get, is If i break the Law , I'm responsible, Not You , Not your fellow Hammies, I wont do the Crime , If i cant do the time!!! So what, and Why is it any of your Business what I do, or anyone else for that matter, unless it impacts you, If I sold dope to your kids , that would impact your life. But there are millions of people out there that have no earthly Idea that anything cb-related goes on, why because it does not have an impact on their Life. So Get Over it!!!>>

Here's the issue I'd like to bring up.

Illegals like Mr. Pain exist because they have never in their life come up against peer pressure to do otherwise. They feel it is their right to do anything they want - however antisocial, inconsiderate or harmful to others - and have nobody say anything to them about it.

Unbelievable, huh?

But it's true. This guy is positively INDIGNANT that someone dares intrude on his rights to be as bad a boy as he can. Because, up until now, nobody has intruded. Guys like him say "Don't pick on me, there's much worse in the world" etc. etc. They will make any and every excuse for their actions. They desperately want you to ignore them. They want you to feel it's hopeless to stop them. Or stupid. Or impossible. (You watch - some of the stuff they will come up with to defend themselves is inspired)

This is why the CB band in many areas is such a cesspool. Good people just don't get involved. Unless it impacts them personally, they'll "mind their own business". Which is what Mr. Pain feels is the way everyone ought to be.

So you now have a generation of radio criminals that have never before felt any peer pressure to be considerate of others or obey any rules. Because no one has ever said "hey, what you're doing is wrong".

In fact, what you've got here in rec.radio.cb is a negative peer pressure. "You're not cool if you're not operating illegally" seems to be the operative slogan.

Pretty sad, huh?

Is there any hope?

Stay tuned.

Sincerely,
Aaron Voobner
FLRC, (Friend Of Legal Radio Communications)

>world
>effects , he is sadly mistaken .
>
>i do not wish him personal harm .
>
>people can learn lessons in other ways .

Posting my info was not a complaint of mine. I don't care. I knew going in what would happen in that regard. I have seen it here before. This has gone on long before me, and will go on afterward. That is exactly why I pissed and moaned so much on this NG. This NG rarely allows opposing viewpoints, and it is funny to watch the jumping up and down over them.

Violent threats are over the line. If a flame war pisses me off I just don't go there.
People, you can call me anything you want. I have never threatened anyone here, this is all done for humorous purposes. It has been gleefully "done back" to me as well. I don't care, I laughed.

Whatever your feeling about my posts, they threaten no one, and no one has a right to make violent threats on the NG, or anywhere for that matter.

Don't hand me this "that's what you get" bullcrap. That is a totally unreasoned arguement, and bases itself on the idea that there is some right in this world to cause harm to others.

Anyone is welcome to come to my home. Just come with peaceful intent or be prepared. Also, will respond intelligently and in a non-sarcastic manner to anyone who wishes to attempt to justify the pro-Illegal point of view.

Think or say anything you want about me; it is water off a duck's back. I can take it and dish it out, so who gives a rats rectum?

As for people with this violent threat mentality: Think before you post. The ass you save may be your own.

To the hard-core keydown guys, export radio and amp dealers, swing mod techs, freeband clubbers, radio pirates and HF bootleggers:

I have a solution to all this unpleasantness.

Why not apply to Usenet for your own special little newsgroup? Call it rec.radio.illegal. Since your charter would state that topics are to be strictly confined to illegal aspects of radio, you could post there and be within your rights not to be challenged. Heck, you could even have a moderator to keep everybody in line (or out of line, as it were).

Thinking of you,
Aaron Voobner

>
>

I am not about to argue with what is a simple observation of fact. What I am going to argue with is the interpretation of this 'fact' by some in Pain with Twisted Heads. It starts with the misconception on both sides that CB is in some manner a subset of Amateur Radio; it is not, any more than it or Amateur Radio is in any sense a subset of commercial or Military communication, neither of which has a lot to do with broadcast services. There is no inherent conflict or competition but neither is there a whole lot of commonality. Reasoning on one service from one's experience in the other is not the path to wisdom.

The Tech license covers a multitude of sins ranging from the microwave experimenter thru EME thru satellite junkies to 'bring-home-bread-and-milk' wives and a way to use VHF for hunting trips with the 14-year old. It is not and never was a 'gateway' class to Amateur radio. Joining the auxiliary is not the way to join the American Legion or VFW.

Not that it was not thought of as such or even advertised as such on both sides of the divide. And here lies the problem. And it is not a new one although a Novice at least had some more truth in advertising. Licensing looks the same, no clue there; much like MURS being CB for reasons of non-licensed convenience to the FCC and no better reason than that.

So the codeless Tech is not considered in general to be part of the fraternity although they can serve a purpose in a club much like the auxiliary. Some of us nicer guys do recognize that they wandered in from the cold and try to warm them up a bit with a bit of soup but the next step

is theirs, not ours.

If the next step is to regale us with bowl stories and imply that it is our job to accept him, we introduce him to the last four and suggest they start a poker game. If he comes out of the Broadcast Service we introduce him to the program committee chair and hustle him for a tour of the station. Equal opportunity grumps us old Extras. If he is in the service business, he gets put to work on the QRP project which is more than likely a CW transceiver which both gives us someone who can solder and delivers the hint that one joins the fraternity these days at 5wpm. Hey man, we are almost as good as Southern Baptists at separating sheep and goats.

If we get a lot of codeless drivel, even though a good number agree with him, he will be chalked up as an idiot for no better reason that we have someone at war with reality. Wandering in with your hat on backwards and some remnants of pubic hair around one's chin probably isn't a great way to win friends and influence people either. Spare the attitude, OK?

So yes, if the original purpose of getting the Codeless Tech was a status game, it will fail miserably at the local radio club. So it is no giant surprise that it becomes a status game on 11 meters, out of default if nothing else. Now that anyone can buy a rig to talk to the drive-up at Mac and Don's, what the hell else is there left to do?

There is no proselyte like a convert. But even this does not explain WWM or for that matter the good Mr. Voobner (who I do not believe to be real).

Your conclusion re amps and OTs is again based on experience from another service. Those of us who even know what they are (most amateurs run barefoot at 100-200 watts quite happily) find them more hilarious than dangerous. Most importantly, we have learned years ago that one does not change behavior thru criticism or crusades. Or for that matter regulations.

Time to go do a bit of ditty-bopping.

Dick McCollum NBK

Normally I let most misinformation pass, yours deserves special comment. First in order to get a license, you must take a test administered by a certified Volunteer Examiner team. (VE) consisting of 3 members. To state that one could get a license from a couple of his buddies is totally incorrect. Years ago it was possible, under the Conditional Class license, it was administered by a general class licensee if you lived more than 150 miles from an FCC office. That ended when the VE's took over the tests. Even a hint of impropriety gets full and immediate investigation, as evidenced by the scandal in P.R.

For you to suggest otherwise is irresponsible and not founded in facts.

Maybe because they are out of date. 4 watt radios may have been fine when Christ wore sandals. But the needs are different today. If the regs were changed to allow higher power it might just create a stimulus to the industry to provide better cleaner gear instead of gray market imports and old chassis designs that the techs can soup up and the radio still has its type accepted sticker.

The four watt limit dates from the days when the first video i.f. was at
25.75 MHz and it took cast-iron cajones to work on 27 MHz. It never did
make any sense. Amateur practice on 28 was to run about 20-25 minimum. The
Gonset Communicators of the day, known as Gooney boxes, did, however, use a
modulation system that held it to 80 percent or so.

Allowing 25 would probably just make linear building a tad easier as will
the upcoming move to 36-42 volt electrical systems in cars. The biggest
problem of 11 meters is sunspots.

The rumor about DaveMade being busted turned out to be untrue.

OK, I admit it.

Stevearino (catain@navy.org) was right.

I know nothing about this stuff. I need to learn.

Is it true DaveMade is run by a guy in New Jersey aka "Concrete Man" and
is financed by or finances a sideline cocaine business?

Is XForce the company out of Chicago run by Dennis Ostrowski and
co-owned by CoaxKid, Inc. ?

Is NoName a basement operation run by one guy in the New Orleans area?

Hope somebody can help. Thanks,

Aaron, FLRC

Hello 459,seems every time I turn on the radio these days I run into someone who participates on this NG.And every one of them has got a superior sounding station,yourself included.Also every one of them conducts themselves in a respectful manner while on the air.And thats just fine by me!Judging from the sound of the station you're running I know I'll be hearing you in there again.
Happy holidays my and keep it safe my friend.

Hello Jeff thanks for the reply.I guess I've had enough of watching so many fish getting shot in one barrel.It's a very simple solution,take away ANY AND ALL attention and they always go away. Respond to them and you become their enabler.In very simple terms,If you keep responding to them,even once,you become the reason for them to stay.
I'm for one am not going to be one of them.And as far as running off to some other NG.,piss on that I'M GOING NOWHERE.
Merry Christmas to all

Would you say that you complain less because you have more options? I do not have a amateur ticket, and I don't complain at all. This by no means makes me better than the next guy. Over the years I've been able to realize that I have options. I can go to another frequency, change antenna directions, wait my turn or turn the damn thing off. I live in an area that has a host of issues that can prevent communications. We even have a preacher that basically says "If you ain't talking about JESUS, you ain't talking!" We used to fight for hours. The on going joke was I'd make him stop talking about JESUS and start talking about me. Since then I found out that JESUS was pretty cool so I had to find something else to do. To this day I can ask him to stand by so that I can make my call and my contact and I will go to another frequency.

I will be the first to admit that I don't use CB the way it was intended to be used. However, I do not throw dead carriers, play music, ghost talk or plug ears. It's not my style. Neither is complaining. I just don't think is as effective as using one of my many options.

From: Andrew <akocsar@smartt.com>
Message-ID: <914a4u$uv3$1@newsfeed.smartt.com>
Source record: 63252

If the resistance of a length of coax (6, 10, or 50 ') is approximately 50 ohms, why do the antenna manufacturers reccomend an 18 ' length. I'm assuming now that there is more to the match than the resistance of a particular length of cable.
Thanks,
Andrew

1871. Re: Coax Question

Message-ID: <3A35B1F2.19DE8F17@hotmail.com>
Source record: 63253

The reason for 18 feet is so if you have a mismatch, the voltage at a half wavelength is at a null or minimum. If your SWR is 1.5:1 or less, any length of coax will work fine. 50 ohms is an AC impedance. The measured DC resistance is a function of distance and size of the conductor.

I personally wouldn't use RG-58 for tying newspapers. Make sure the center conductor is STRANDED for mobile use. Solid stuff will break quickly from flexing back and forth.

We also just pulled some Motorola MSF-5000 Multi User Repeaters units off the air, these are 100 watt units, checked two out today, have 1 unit with a Zetron Model 37 Repeater Controller (any PL & any DPL, off air programmable) and another MSF-5000 with a CSI 154 Controller, (any PL & any DPL, off air programmable), the repeaters are programmable with internal duplexers. Price for these units is $2000.00 your choice.
Have another MSF-5000 coming out of service with a Zetron 45B controller, multi user & INTERCONNECT Controller for $2500.00.
Also just picked up a MSF-5000 single user repeater (convertible to multi user) with a second satellite receiver and voter system, excellent shape for $3000.00.
Will have a couple more MSF-5000 coming out of service soon, another Zetron Model 37 controller and a couple with Zetron 38 Panels installed.
These make super UHf trunking repeater systems, have a total of 5 or 6.
Also pulling out a extra clean TAIT 100 watt programmable unit, with Comm Spec panel and duplexer, $3000.00.
Would sell any of the above units without controllers for $200.00 less each.
The MSF-5000's and the TAIT are UPS shippable
Would consider an interesting trade.
These units are programmable for GMRS SERVICE

Why do some of you CB people run illegal power?

All you do is interfere with other peoples lives. How would you like to wake up in the middle of the night hearing voices. It was coming from my phone witch was on the receiver. Echoing whistles and other odd noises on my stereo while watching a rented DVD movie. I bet he is running several hundred watts. Saw the amp setting on his desk the first time I complained. How bad he bleeds varies, I guess to how much power he has on. Turning screws and cutting circuits in the radio dirtying up the signal is bad enough but amplifying it just makes it worse.
I hope the US government makes people get CB licenses again.
Congress has a bill pending to give local police authority to in force FCC rules governing CBs. God I hope it passes. A few bad apples are going to kill it for all of you.

Just had to vent a little. My new neighbor is driving me mad.

Chas

Andrew,
That 50 ohms isn't resistance, it's impedance. Resistance
and impedance are not the same. Impedance is found in AC circuits,
and is a combination of resistance and either capacitive, or
inductive reactance.
There is no logical reason for manufacturers using a length
of 18 feet for a feed line, other than it seems to be an 'average'
distance from the radio and where you mount an antenna. 18 feet
has no electrical significance to frequencies in the 27 Mhz range,
it is ~not~ an electrical 1/2 wave length.
'Doc

Yes, I have heard he is a east Coast Mobster he got his name by fitting guys
with "Concrete" shoes and throwing them off the piers in south philadelphia
if they crossed him of course I am sure it is all a front for the cocaine
business .. "wink wink
>
> Is XForce the company out of Chicago run by Dennis Ostrowski and
> co-owned by CoaxKid, Inc. ?
==========
Again, correct coax kid closed down there web page to devote more time to
xforce Ostrowski is the brains behind the operation and 1 of the founding
fathers he splits time working for lucent as an engineer the pay sucks so he
moonlights with illegal amps as the real bread winner

>
> Is NoName a basement operation run by one guy in the New Orleans area?
==========
Yes, no name is a basement operation all the way take a good look at one of
there amps and you will see this. but they are not in new Orleans you see
the water table is to high in NO so a basement is out of the question there.
my sources say they are in Maryland ... Hope this helps clear up any
mis-understandings

Antron 99's and similar fiberglass antennas are known to cause
interference. A slight mismatch causes the shield to become part
of the antenna and radiate.

You have a NG of your own. Actually several. They start with
rec.radio.amateur.*. Why don't you stay there?

As a non radio user I hope the FCC gets help and cracks down on illegal power used on CBs esp base stations. My new neighbor is bleeding into phones in the area and on my stereo. Several complaints by me and others have got him using the amp less but still turns it on for a few minutes every night.
Can you imagine waking up hearing a voice coming from the phone setting on the table at 2AM. I don't think he cares to much about the FCC. Told me the FCC doesn't have the manpower to do anything.

As for the 28mhz problem the population keeps growing so the bands seem to be getting smaller. Add the lack of in forcing rules and this is what you get. The FCC should have gotten a handle on this before it got out of hand. Reading this newsgroup shows how widespread it is with all the illegal radios and amps openly sold. It will take major resources to fix it now.

There is a bill that has just been passed and signed into law that lets the local law enforcement agencies aid the FCC in taking care of this type of problem. Talk to your local police.

>Christ wore sandals. But the needs are different today.

I have never found the need for any more than the legal limit. If
anybody needs more than that, they are not using the band for what it
was intended for, and they should think about getting their ham
liscense. Unfortunately, too many operators are either too lazy or too
stupid to do that. I'm still waiting (in another post) for any valid
justification that proves otherwise.

>If the regs were
>changed to allow higher power it might just create a stimulus to the

Agreed. But I also think that allowing higher power would send up a
flag for the illegals to run even more power in order to step on the
legals.

Just to add that as long as your SWR is low, the shorter the coax the better. Also avoid using foam dielectrics for mobile installs - it is very prone to shorts under even moderate heat (the vehicle interior in summer can be enough).

Ok.

From what I gathered and ascertained from this group, there is a contingent of personalities that do not agree with "illegal" CB radio operation. Fine.

There are, at the same time, frequent posters here who do run illegal CB radio operation... that's fine too.

To justify the means? What justification does a person need to explain in his or her activities? To run illegal CB radio equipment is that individuals "CHOICE." If anyone should take that Freedom of Choice away from any one person is guilty of being a downright COMMUNIST. That is a rather large term to opinionate on but... damn!

Let say for instance, now this is just an example, rec.radio.cb's beloved "heckler" N8WWM was gay (don't take this personal Doug... its just an instance), and his sexual/intimate partner, Gunny Sparkles (just an example), indulged in homosexual activities. Under Local Ordinances, State and Federal law, homosexuality is illegal... right? But people are starting to "look the other way" or "ignorantly not notice such pursuit and indulgence..." "don't ask, don't pursue" might I add.

Now take for instance myself, ONE37, running a 50Kw splatterbox (which I cannot afford on a Military man's salary) of unknown proportion talking to, lets say, a guy in NYC on 27.025. Illegal as all of hell under now State and FCC regulations and pursued with vengeance and malice. Why?

Is it now that we are looking for a justifiable necessity to blast a harmless entity??? We sure can clean up the airwaves but we can't clean up our sense of morality, our sense of values, our sense of ethics??? Is it because its easier??? A scapegoat for fear of offending??? Justify this please.

My justification for the Illegal OP is simple. It is fun, it is harmless and it is with accord of a sense to spread the goodwill to all who wish to be communicable. Just like Amateur Radio but without a license. See, the 13wpm code testing in the old days was a chore to be had and a challenge to be passed. I respect HAMs who aquired this talent. But since the law written by the hams, of the hams, "for the people" (FCC Reg Title 47 CFR PART 95 Subpart D Citizens Band (CB) Radio Service) for governing bandwidth HAMs did not want in the first place (now are trying to take back), tends to have me lean in a "no favor of" direction. Don't get me wrong. I do respect HAMs (code or not) but to a certain extent now due to the rivalry between radio services and harsh examples projected by a few here as well.

Bash homosexuality... for they bring tarnished values, achromatize morality to our nations children and causing an incurable disease not only found in

African monkeys, drug users and blood transfusion infectees, but in homosexuals as well. Step up law enforcement in bars, clubs, taverns, streets, highways, waterways and such. Drunk drivers and speeders claim more lives each year thru vehicular manslaughter than people dying from Cancer. Smack child molestors, mass murderers, gang-bangers and "mud-slinging NO CODES" with death penalties for being "straight stupid" in their endeavors as idiots.

Did any of the CBers chase you off the frequency into higher and lower bands? Let it go. Pride can be very volatile. It could result in serious consequences. Does it really break your heart to hear a little bit of QRM from 27.085, 27.025 and 26.915? They are within their assigned frequencies. Now for freebanders, well, malicious interference with an intent to cause disturbance to the Amateur Radio Service is pursuable. Triangulate there postion and take them down. But not here on this NG. A majority of the people here are legally operating within the PART 95 parameters. Don't bash them all... Ham and CBer.

I, myself, and a few here on the NG don't want to "fuck" with the local HAMs. Never intended to do so in the first place. Sorry I got a little longwinded, but damn, let the bashing end.

Ipo,

I read the rest of your post, but let's stop right here, as it brings up a vital point. As I have explained before, merely wishing to take the rap for one's illegal activity does not justify doing whatever one pleases.

Freedom of choice does not extend to actions which affect other people. Illegal radio operation affects other people. You can read for yourself posts in this very newsgroup from individuals who complain of their consumer devices being affected by high power linears. To say nothing of the thousands of legal CBers who are victimized by selfish inconsiderate idiots who have made the band a cesspool of profanity and chaos.

How can you deny this is true? To deny it is to close your eyes and turn your back on reality. Mi amigo Camacho, no one wants to take your freedom of choice away. But if you have no sense of personal responsibility for your actions then society can and will prevent you from victimizing others.

What you subscribe to, my friend, is the Law Of The Jungle; survival of the fittest; a contest of the strong against the weak; a predator's quest for prey. But a civilized society must evolve beyond this primitive code, Camacho, and you, as a man, as an hombre, must also evolve, too.

I hope someday to turn on my CB radio and not find bullies making sport out of victimizing others and foul-mouthed children equipped with linears sold to them by men with no conscience.

Sincerely,
Aaron H. Voobner, a friend of legal radio communicati

Hello Andrew: The coax does have resistance, but it is not a consideration in the way you question is said. If a long length of coax is used it will have a amount of loss, and make the antenna look as if it has a wider bandwidth than what it really has.

The coax is a broad band transmission line, meaning it is designed to transfer RF Energy from one to end to the other, at a impedance of 50 ohms, which means a voltage to current ratio of 50. Or for every unit of current there will 50 units of voltage. Simple meaning of 50 ohms you won't see in the books.

The coax lengths will not change the coaxes impedance. If the transmitter and antenna are 50 ohms impedance the coax being a transmission line at 50 ohms impedance, will allow for maxuim power transfer. How ever some SWR is seen in practical antennas, and a small amount is allowed.

This subject gets thrashed around quit a bit. If the antenna isn't properly grounded of has some kind of problem, then changing the length of coax will change the SWR. But I have used what ever length will reach the radio to the antenna.

Yes there is quit a large amount of things to consider about matching. And most everyone does not understand it all, I don't. Many times I half to look in books to get a guidance or idea. Also don't be afraid to find things out by trial and error. Everybody else does.

Jay in the Mojave

Scott,
If you do not freeband, then I owe you an apology. For some reason your attitude doesn't come thru from your messages - many of them do not discourage the use of illegal gear, on the contrary. Could of course be I misunderstand your messages. If you're a legal Cber, fine, and 73 to you.
Gary, oh8mfh

Nope, taking away that FREEDOM as you call it is called compliance with the
law.

As per your previous posts, you hold that a person has the right to
make any choice regardless of the law. To the extent that a person can
choose to break the law, I agree, but they do not have a 'right' to do
so. There are reasons that laws exist. If a law is unreasonable or in
conflict with another law, then there are accepted ways of changing
the law. It is not generally acceptable to break the law until it is
repealed de facto. Yes, this happens, but very rarely, and it is
unlikely that it will happen here.

>Let say for instance, now this is just an example, rec.radio.cb's beloved
>"heckler" N8WWM was gay (don't take this personal Doug... its just an
>instance), and his sexual/intimate partner, Gunny Sparkles (just an

>and Federal law, homosexuality is illegal... right? But people are starting
>to "look the other way" or "ignorantly not notice such pursuit and
>indulgence..." "don't ask, don't pursue" might I add.

What a person does in their own privacy is their business _unless_ it
negatively affects the rights of others. This would not happen if all
operators were to use equipment that meets strict requirements and had
a thorough understanding of the general aspects of radio communication
and electronics. The reality is that some do and some don't. The
operators that choose to not act responsibly cause problems for
others, including non-operators (which the operator usually ignores).
Another effect of illegal operators is that their actions will
continue to tightly restrict the band, and never allow restrictions to
be loosened. For that reason, even operators that act responsibly in
every other respect should be opposed to these idiots, and many are.

>Now take for instance myself, ONE37, running a 50Kw splatterbox (which I
>cannot afford on a Military man's salary) of unknown proportion talking to,
>lets say, a guy in NYC on 27.025. Illegal as all of hell under now State
>and FCC regulations and pursued with vengeance and malice. Why?

Because radius expands with power. If everyone pumped 50KW, it would
only allow a hundred or so operators to work at any one time in the
entire US. But then they would be talking over themselves, and then

they would want more power, etc. There must be a cap. There is a cap for every service and band, even broadcast. That's another reason why laws, and the FCC, exist.

>Is it now that we are looking for a justifiable necessity to blast a >harmless entity??? We sure can clean up the airwaves but we can't clean up >our sense of morality, our sense of values, our sense of ethics??? Is it >because its easier??? A scapegoat for fear of offending??? Justify this >please.

This is not a reason not to restrain it. Part of a society is to have moral and ethical standards by which the populus needs to abide. There will always be a few that deviate from the norm. Those that deviate severely are severely punished. But anyone that chooses to eat on all fours at a nice restaurant will probably catch some flack as well, and rightly so. Most people would discourage such behavior.

>My justification for the Illegal OP is simple. It is fun, it is harmless >and it is with accord of a sense to spread the goodwill to all who wish to >be communicable.

It is not harmless, because illegal operators are depriving the rights of those that wish to legally pursue the same "goodwill" you speak of.

>Just like Amateur Radio but without a license. See, the >13wpm code testing in the old days was a chore to be had and a challenge to >be passed.

Then why should they not get a license? Because they choose not to? Then they choose to break the law, deviate from the accepted standard of behavior, and accept the consequences from legal authorities and society.

>Bash homosexuality... for they bring tarnished values, achromatize morality >to our nations children and causing an incurable disease not only found in >African monkeys, drug users and blood transfusion infectees, but in >homosexuals as well. If your neighbor is unwilling to voluntarily cooperate, there are a few things you can do.

First, log all incidents caused by his operation. Log the time, date, description of the incident, and how it affected you.

Second, notify the FCC and the local law enforcement and send them a copy of your log, CC'd to your neighbor. Continue logging.

If the operator is still unwilling to cooperate, you need to talk with an attorney, because you may have local and state laws which say that your neighbor is causing and maintaining a public nuisance. If so, not only can the courts force him to abate that nuisance, you could also receive compensation for damages. But always talk to an attorney first.

Aaron believe me no one here is that desperate. I am part owner of an ISP. Within seconds I can perform a TraceRT which would tell me you real IS provider and your individual logon hex code, which you are not worth the time. It was you, in a previous posting that directed the group to QRZ.COM. It was also you, who, in a previous posting, stated that personal threats would not be tolerated. Yet you are demonstrating, with some sort of immature coat-tailing, a non viable attempt to intimidate people via newsgroup threads. You are in fact facilitating the same threats that you've previously posted that you are against, only they are in a disguised form. No-one here really cares or is intimidated by your tactics. All you are doing is eating up NG bandwidth.

BTW stop timeing out the repeater.

Wow, what radio is modified by turning screws and cutting circuits?
Never heard of that before unless you mean a modulation adjust and then
he cut out a board and put in a different one.

Hell, Richard. Nowhere did I imply that it WAS indeed a subset of hammie radio. And nowhere did I utilize the word "fact" you so loosely tossed out. He asked a question about techies and I gave my opinion, nothing more, nothing less. Don't read too far into it. Why flick your booger at me now after all this time? I only disagree with you saying MOST hammies run barefoot. Thats pure golden BS if I ever came across it, and a stereo typical view as well. MAYBE, just MAYBE, in your area, they do. But in no way possible can you say that with a straight face AND actually believe it. They lie. I have heard them lie. Hitting repeaters with legal limits from short distances, etc., hitting each other with a kw or two to talk across town. Please Richard. Maybe these newbies will accept this, but cut the rest of us some slack. You want to slam me with the issue of freebanding, fine. But that stuff about barefoot hammies is all malarkey and deep down, I know that you KNOW it is true.

1932. For Sale-2510, PC76, Plus 3, other stuff

HR2510, 10/11M coverage, looks and runs very well, stock mike and manual, hate to sell it but other hobby requires some cash. $195

Uniden PC76XL 40 channel AM only, with cleanly installed Connex dual pot echo, peaked and tuned for big audio, nice shape, $75

HyGain IV 40 channel base AM only, looks ugly but runs just fine, with the good old PLL02a chip, for easy mods. No mike, will throw in a stock type hand mike for you to wire up, OR.....

Turner Plus 3 base amplified mike in good shape wired for Hy Gain above. Both for $50, mike alone $30, radio alone $25

Cobra 139 23 channel AM/SSB base, looks very good, gonna need some attention from long storage. Gotta be worth $20.

Sylvania SWR/Power meter, reads modulation as well, and has a 12V lead for backlite, small enough for mobile installation, 10/100W scales, pretty good shape, $17

Another SWR/PWR meter, no lite, nice cond. $12

Uniden Pro 510E 40 ch. micro mobile, lights up, sometimes it runs fine, sometimes it seems to go out of lock, cold solder joint? VCO adjustment? U-Fixit. Looks good, w/mike. $15

Will consider swaps for some of this, looking for Wilson 1000 mag mount antenna, 25 LTD/PC66 for small truck installation, scanners, amps, whatcha got?

Prepaid MO only, shipping/ins via USPS extra. Email replies please.

1933. Re: Why is it that Tech's are the biggest complainers about CB amps?

>

Very well put Dick. I wish other Amateurs would follow your perspectives. It appears that once a Technician class operator, one who's origins were from the CB arena, acquires his license, he somehow feels that he has broken free of some sort of CB bondage. In addition, it appears this same person then feels they have some kind of *authorization* of sorts which predisposes them to look backwards into their origins and attempt to right the wrongs of others to whom they've left behind in the CB hobby. Basically, they now feel that they are the Gen. Douglas MacArthurs of CB radio; "I will be back" and "this time I have the muscle". The muscle obviously being the Tech license itself, which we both know is a misnomer.

As eloquently stated by you, CB is NOT a sub-hobby nor does it have a symbiotic relationship with amateur radio. Yet these very individuals (some Techs) are compelled to look backwards into their own past and try to coalesce these two distinctively different pastimes. The reason for this appears to be two-fold. The first is because of the confusion the general public may have with the difference between Amateurs and CBers, and secondly, these Techs apparently did not have an amplifier large enough that permitted them to say what they wanted to say when they were on CB.

It seems that these are the biggest underlying gripes that Amateurs have with CBers. Its not that these CBers are steadily interferring with anything (cable tv took care of 90% of the TVI problems), its because they (Amateurs) may be accidently mistaken for a CBer by the general public. Ive personally been in the presence of Amateurs who've been accidentally labeled a "CBer" by a member of the general public only because of the obtrusive antenna on the Amateur's car. This person became highly insulted, so much so, that he began a rant describing the differences between Amateur radio and CB radio. All this to a person who really didnt care. I think that this is the very reason why every once in a while you'll see these individuals bombard this NG with hyberbole. We both know all of the rantings are NOT going to change anything because the FCC has much larger problems to police (ie. illegal commercials, pirate radio, etc.), and the government does not have the funds to initiate covert nationwide CB SWAT Teams just to satisfy some disgruntled individuals. I know I dont want my tax dollars spent on such nonsense. Alternatively, FCC enforcement of CB was needed in the 70's when broadcast TV was legitimately being interferred with however those days are long gone.

The beef that these Tech's have with CBers is not about illegalities....Its about appearences and self righteousness.

PS: I wonder if these same people tell speeders to slow down on the highways?

what difference does it make if your a ham or a cber if you run 1500 watts ,
none the only thing is you need a license what does the piece of paper do
nothing you can wipe your ass with it it doesnt mean anything it means you
rememberd a few answers to questions on a test it doesnt mean you are any
better of an operator than the next guy. go stick your lips on a tail pipe.

<> Why are you so concerned with an enforcement campaign? Why would you
> want to prevent an enforcement of CB rules?

Im not concerned with a CB enforcement campaign because like many others, I confidently know there will never be one by the FCC. The problem is not large enough to be justified as it was in the 70's. The biggest problem Im concerned about you using up all of this bandwidth with your nonsequential propaganda. You're attempting to change minds that wont be changed. You remind me of AL Gore speaking to the Wall Street Business Mens Asso.

Do they really want to here him?......NO. Are they impressed?..........NO.

Take your concerns, if they are legitimate, to the sources that you believe can make a difference.

not true dick, we love the sunspots. the band would be boring if it was the same day in and day out like some of the lower hf bands. here we can have long extended periods of quiteness during lulls and at night or we can have world wide rip roaring dx during the high times like now. most cb'ers have lived and operated thru more than one sunspot cycle and are still around.

hey twist, remember when freddie came on this ng, and starting talking
all that stuff about helping us be hams and whatnot. now look at him,
he is still here after all these weeks. i guess him and the rest of
this cadre of ham rifraff seem to be enjoying themselves jumping on cb
types, oh yes and old freddie is mistaken , it is still quite possible
to get your ham license without taking the test. it is amazing what
$300.00 a piece in payoff money can do, hmmmmm????? remember freddie,
its just like a lot of you say. you all used to be cber's. so i do sir,
know how you good buddies think. thank you.,.......cd is out.....

I used to freeband. But after an incident with a local, I put that
radio away. I live way too close to the Laurel monitoring station.
I run a clean radio, don't cuss and don't splatter. Who cares what
I run from my mobile. I don't key near stores and homes. I try to
NOT interfere with TV's and phones. I haven't heard any complaints.

I don't like cussing and overmodulation, so I stay on sideband.

Greetings!

Just to stop and point out something.

I've been on this NG for over 5 years. It's a lot of typing indeed.
One thing I've learned is...

If you can answer the question, please do so. If you feel it's not
right to publicly post that information due to the legalities, then
it's far kinder to say nothing at all and Email direct if inclined to
at least say something.

I've been flamed numerous times for "forcing legal operation" down a
throat or two, but it wasn't the intention at the time.

I now simply throw it out their with a disclaimer...

FOR EDUCATIONAL PURPOSES ONLY.

There, that covers it...;-)

1948. Re: Why is it that Tech's are the biggest complainers about CB amps?

Newsgroup: rec.radio.cb
Date: 2000-12-12 16:21:46 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <3A36509A.7788@bellsouth.net>
Source record: 63393

twistedhed,

I don't have stats about how many hams run power *all* the time, but I know I don't, and I don't own an HF amp at home. I have a small 90 watt VHF amp I use to work simplex and distant repeaters, but I operate the local ones with 5 watts. With the 100 watt rig (HF), I can talk all over the world and I don't think it is worth the trouble or expense to have a 1500 watter. I was testing a 600 watt radio once in anticipation of selling it. I kept hearing a "zzzzzzzzfffft" which I couldn't seem to locate. I thought something was arcing inside the radio, so I concentrated on watching the rig as I transmitted. It didn't do it all the time, just at random, but I kept watching the rig so I could find what was arcing. At one point I happened to glance away from the radio towards the wall bulkhead connectors when.....ZZZZZZZZZZZZZZZTT! It was coming from the wall feedthru. Just a simple matter of a loose connection. This issue plus TVI, RF exposure, and maintenance have caused me to decide not to actively pursue "high" power amps. I wouldn't say I would *never* run power, but since I have been able to operate in a satisfactory way withOUT an amp, I just see no real need for it. I can't say how many hams always run maximum power--never really thought about it. Venturing a guess and judging from what I hear on the HF bands, I'd say it's about 50%-maybe a little more, maybe a little less. The ones I talk to who *ARE* running extra power are usually running about 500-600 watts, again that's about 40-60% of the ones I converse with. Of course, none of this is meant to dispute what you say, I'm just offering an observation. One good thing about the Amateur HF bands, I can always find somewhere to work where it is relatively quiet-except when they are having those pesky contests. Surely, my attitude *may* not be understood by those who believe that an amp is de rigeur at all times. My comm training comes from the military, and I always subscribe to the military rule and to the "gentleman's agreement" (unwritten rule) in civilian radio: Use only the amount of power necessary to establish and maintain communications. So, if I can reliably talk to a station with 5 watts, then I should use 5 watts. If it takes 100 watts,.....and so on. Therefore, I use the rig "barefoot" most all the time. I do have an amp in the mobile, but it hasn't been turned on in weeks. I really don't need the thing, but I keep it in case I run into a rare DX station and really *need* the extra ooomph. Still, I could do without it.

The value of a piece of coax is it's surge impedance determined by the diameter and spacing of the inner and outer conductors.

18 feet represents a half wave and has the characteristic of repeating at the near end exactly what it sees at the far end. If you were to short the far end, the radio would see a short. Now lets connect a 1/4 wave length of coax and leave the end open, the radio would see a short, conversely if you were to short the far end the radio would think that nothing was connected to the back of the radio. Have you heard someone say "I adjusted my SWRs by adding/subtracting coax" They really did not adjust the SWR, they simply picked a length of coax that transformed the actual load to a 50 ohm load that allowed the SWR meter to see 50 ohms and indicate 1:1. What the actual load at the antenna is, is anyone's guess. Take the earlier case of the 1/4 wave length with a short looking open, obviously I can adjust the length to a 50 ohm point and have 1:1 on a piece of shorted coax. You might ask will it get out? Nope, but it makes my SWR meter happy. SWR means nothing except that a conjunctive match allows the greatest transfer of power. The best SWR I have on my ham antenna without a tuner is about 8:1 and it gets worse on other bands! The tuner allows my radio to see 50 ohms and the radio works great! I have 167 countries on 75 meters which is no small feat. On 10 meters I have worked nearly that many on a single contest weekend.

In short SWR's are the source of more myths and urban legends than the internet ;>}

You are technically correct about the 1/2 wave thing. But! if you think about it, a perfect 1/4 wave antenna has an impedance of 25 ohms. The normal mobile installation is about 37 ohms do to losses and imperfect ground plane. If you put the 18 foot on a smith chart you will see it does a good job of transforming the 37 to 50 and makes everyone's SWR meter happy. I took some liberties in a previous post by calling it a half wave for illustrative purposes, but the idea is the same.

Greetings!

Well, to answer the question, let's clear some things up...

You mention resistance of the coax, er - it's the Impedance of the coax. It's a measure of RF impedance in an ohmic value. This value is arrived at when tests doen to the coax are broken down from a series of different measurements, of capacitance, inductance at RF frequencies - and the coax is "rated" with this impedance.

Now, to answer the question. If you look at the Manufacturers recommended lengths, you'll find other "impedance" types used, like RG-59 which has a 72 - 75 ohm impedance and it too requires a specific length for a particular set-up [co-phased]. Some antenna makers recommened other lengths too, like 9 feet or 21 feet for certain types of antennas in their brand lines.

Why coax length? Well, if you can't tune the antenna, the antenna was designed [coiled, wrapped, tested, sold] to show a resonance, or low SWR if you use a particular length. Some other things need to also included in the above statement. One being where it's mounted, how it's mounted, and what type of mount are you using. [Hint: Mount and location play a big role here]

If you did all your homework right, you can buy that antenna and use any length of coax you want. Sometimes that doesn't work, because the person doing the homework decided to mount the antenna somewhere it doesn't like to be mounted at or he's using the wrong type of mount. So, along comes that little "placard" that screws up the whole mess and you're forced to use that particular length just so you can use the radio with that antenna.

Which brings up, "match" or SWR, a ratio. The power going to the antenna and from the antenna. Both types of power are directly related. You have one direction with something always going in the other direction. How much is going in the *wrong* direction [reflected] can hurt your radio - as well as create a lot of interesting and frustrating problems that can be solved if you simply re-do the installation properly and re-tune the antenna to make it show the low ratio of power absorbed by the antenna [Forward - going to the antenna] and using it properly [Ideal SWR 1:1] so it isn't returned out of shape [Reflected - going away from the antenna thru this coax] and thereby increasing the ratio. SWR of 2:1 for example.

It's not necessary to acheive an SWR of 1:1 or to simplfy, SWR of 1 - if you don't get this you might want to double check your work to see

if things are set-up right. Anything with an SWR of 1.5 or *less* on
the meter reading for reflected or SWR setting is acceptable.

Whats on your mind?

yes i know of some cases with the funds i mentioned having passed hands. freddie this is going on, believe me, even today. as you said , many of you hams used to be cbers and now you are hams. well some of you are legit and some of you cheated. so what. i don't care. and i am not going to finger anyone for doing it. it is their business. come on now freddie , cash talks and credit walks and some of your ham radio generals will be, shall we say, corrupted for a certain sum of money, after all you all used to be cbers , right.... so you have to understand, cbers are a crazy bunch , but many of them can be resourceful at times. now having said that , i will say this. people who live in glass houses should not throw stones. or as they say in texas freddie, if you raise a bunch of baby black birds you had better watch out. they may grow up and peck your eys out pal. so you guys go across the street, and straighten out your bunch , then come over here and complain about 11 meters,.....cd is out....

Of course he is..... It's not a right to talk on the CB, nor is
it a right to drive. Put into retrospect, it's a privilege to use a
CB, just like driving. You go out of band or use external power you
chance getting caught. Same goes for driving over the speed limit, loud
exhaust, burning out, power chips, wide tires, bright lights, etc, etc.
I just don't understand why their not out chasing down speeders or
on the car newsgroups that advertise such illegal equipment. That's
right, it is no more severe than speeding or driving with open headers.
Operating a CB is just the same as operating a car, the only
difference is that the do-gooders that drive have enough sense to hang
back and say "he'll get his one day" and you know he will. It's the
same for the CB band, I've known a few people that have gotten in
trouble, mostly in heavily populated areas, not rural.
On the other hand in the past 26 years I have never had one problem
with running power & out of band, that includes a Ham living next door.
I moved to a new home in 1993 and 2 neighbors that came over to tell me
that I was coming over their stereo. I worked with them and eventually
cured all problems and haven't had a complaint since.
The moral of this story is..... You can do this activity without
harming others, just don't venture into or around the lower 10 meter
band and thing should be fine.

Hi Chas,
Well I can throw in my 2 cents..... First I would try to talk to him,
if's that possible, then explain to him that his radio transmissions
are ruining your quality of life. Maybe work a schedule out so he can
transmit at times it won't affect you. Second ask him to help stop
the noise from coming over your stereo & phone, maybe that will stop
the interferance. If all else fails do what was already reccomended,
make logs and keep them accurate.
I must encourage you to first talk to him before going to the
authorites, because you still have to live next to this person.

Good Luck,

FiNgErBaNg

CB laws *have* been repealed "de facto" for the last couple decades in the US, and by your guideline (as well as in practice) it is generally acceptable to break these laws. It is logical to arrive at the conclusion that CB laws are for the most part laws which, if broken in a responsible manner, do not have a significant impact on society.

I do recognize that there are instances in which the breaking of CB laws has resulted in interference to consumer electronics items, although whether or not the interference would have occurred if type-accepted CB equipment was in use is not always an easily answered question. In any case the burden to fix the problem lies with the one causing it, even a legal rig, if he is a courteous and responsible operator.

ONE37, It appears that fags would be in violation of an entirely different subset of "de facto" repealed laws EXCEPT in cases such as for military service in which faggotry can easily be shown to have major negative effects on readiness and morale. If there are instances in which the breaking of CB laws WOULD have similar major negative effects on a critical element of society, I am not aware of them and would support properly written legislation to address it. I can only conclude from this that butt-piracy laws are more necessary than CB laws.

> a thorough understanding of the general aspects of radio communication
> and electronics.

I would generally agree, with the understanding that you describe a perfect world. Even radio operators using stock equipment can easily overload the grossly inadequate filtering of most consumer audio components, so the responsible operator either filters his output or purchases filters and instructs the complainant on their use. As far as the rights of others to share the band, I call your attention to the fact that there are 40 legal channels plus two sidebands each on a CB radio. If one is in use, whether legally or not, there are 39 others to go to. If someone is splattering over 20 of them, there are still 20 others. If the entire band is being stepped on, check your sunspot schedule.

>The reality is that some do and some don't. The
> operators that choose to not act responsibly cause problems for
> others, including non-operators (which the operator usually ignores).

You are absolutely correct that it is the irresponsible operators that ignore legitimate complaints.
There are surely irresponsible radio operators (CB, Ham, Military AND Commercial) who ignore complaints of interference, but to my knowledge NO operator in this NG would refuse to try to fix the problem.

> Another effect of illegal operators is that their actions will
> continue to tightly restrict the band, and never allow restrictions to

> every other respect should be opposed to these idiots, and many are.

It's not the illegal operators, it's the irresponsible ones.
The CB band hasn't been "tightly restricted" for decades, and the new law will most likely only affect areas in which there have been major trouble with irresponsible operation, as it should. Second, I'm almost sure everyone in this group opposes the idiots who act irresponsibly whether legal or not.

> >My justification for the Illegal OP is simple. It is fun, it is harmless

>
> It is not harmless, because illegal operators are depriving the rights
> of those that wish to legally pursue the same "goodwill" you speak of.

There is not one single act one can perform which is absolutely without risk of harm. The realist will be aware that it is the degree of harm which something entails that defines its value, or lack thereof. I don't believe responsible radio operation, even if illegal, causes any appreciable harm to anyone.

> >Just like Amateur Radio but without a license. See, the
> >13wpm code testing in the old days was a chore to be had and a challenge

to
> >be passed.
>
> Then why should they not get a license? Because they choose not to?

Being licensed is a VOLUNTARY and self-imposed agreement to obey the law, unlike CB laws. I wouldn't feel dishonest operating a CB illegally, because the "agreement" to obey CB laws is IMPLIED, not signed for or verbally agreed to. Perhaps that's a compensation you feel I'm not entitled to, and I'm well aware that it's no defense should I be required to allow agents to inspect my station or confiscate my equipment, but I wouldn't feel that I had lied to anyone, and I think you'll find that most CBers (legal or not) are by nature good and honest people.

> Then they choose to break the law, deviate from the accepted standard
> of behavior, and accept the consequences from legal authorities and
> society.

> Sparky, FLRC

That is correct. They accept responsibility and accountability for addressing what little harm stands to be done as well as for the legal consequences. I think level-headed and reasonable posters should take this into consideration. Nobody likes to be hassled for no good reason. If there were good reason, I think we would have seen something besides the same juvenile trolling, finger-pointing, thread-chasing and badgering we've seen from textbook self-esteem cases since day one. I believe a legal radio op who is a jackass is worse than an illegal op who is responsible and friendly, and I believe most would agree.

I would rather have a neighbor that plays checkers than one who shoots the neighborhood dogs. That makes as much sense as your message. Come on, you can't justify an illegal act by comparing it with another illegal act. This moral relativism is one of the major problems in today's society. "I use marjanuia, but I don't do Coke" or "I don't steal anything from people who can't afford it" This is a cop out. If you need to justify your actions in relation to another illegal action you are still ILLEGAL. That being said, there is NO justification for your actions. What you do leaves you open to censure from others and if this upsets you change your ways. If it dosn't bother you, don't try to convince others you have a God given right because it is a lesser crime.

O.k. since 11/21 when Dale posted that he was trying to sell his CB, he has been on a crusade to rid the world of illegal activities on the CB band. Well enough is enough!!! Please if you and Aaron & Sparky are as grown up as you say, why don't you guys act that age. Now most of the response to your post have been less than stellar, that doesn't mean that you have to be less than stellar too. You might want to be careful, because even though what your doing is noble, that doesn't mean some psycho might not come over and take you up on the extra plate of food. Also when making original post stick to the subject "REC.RADIO.CB" you might end up getting complaints to your ISP concerning off topics post. Sure telling people that their amp is illegal, out of bands is illegal and such is on topic, but posting that your "GOD" is not with-in topic. Posting that Scott, twist and such are children is not with-in topic.
Make your point then move on, continually whining about it does nothing but make you look worse than the offenders, especially to the people you trying to impress.

1972. 3's and 8's from Georgia 231

Newsgroup: rec.radio.cb
Date: 2000-12-12 18:05:17 UTC
From: Fred Hambrecht <Fred@w4jle.com>
Message-ID: <915pebfij1@iac5.navix.net>
Source record: 63351

As I enter with my flameproof suit I was asked to pass on all the good numbers from Georgia231 who has gone 10-7.

This person has been the bain of existence to all his neighbors around here, he was handed a copy of the latest federal law, along with the purposed local laws. It was made clear that he would be the target of the first test case under the new law. I observed him trying to justify his rights to do what he wanted on the CB band. He stated that he had heard the FCC no longer controlled CB along with a litany of other excuses. The local law officer explained in a respectful manner that he would shortly have jurisdiction and he should consider this as his final warning. "Hey! you mean your serious?" was his response, the officer responded "as serious as a heart attack" at that point he walked back in the house and brought out what he refereed to as a "ModgeBox" and handed it over to the officer. I believe that this law is going to work. Any way Ga231 sends all the good numbers...

Not to be argumentative Sir! We used up to 1000 Watts DC input on 11 meters prior to it becoming a Citizens Band. The 4 watt limit was set as sufficient to enable the purpose of CB which was SHORT range personal and business communications. Now the old 21 MC IF's were somewhat bothered regardless of power on 15 meters. ;>}

I'm looking for a knob for a Sonar Model "E" (all five knobs are the same, so it doesn't matter which one you have!). I am also looking for crystals for that radio (or any that are for a 455 KHz i-f).

73,
Dean, K5DH

"Illegal radio operation affects other people."
,.............Voobner

Not all of them do, Voob. And not all of them run power, either. Other than that, the only ones it may affect, are the listeners, especially if it's a GOOD pirate radio station, complete with news, political commentary that espouses the virtues of free radio and anti-government coalitions working hard in this country so that the thought police and occasional well intended never gain control. And that's a GOOD thing!

>

Well, perhaps we can agree to disagree cordially. I don't own a linear, never have. Among those I frequently klatch with, one -- a contester -- does out of 11. The most I ever put out on 2 meter FM was 25 out of my old Kenwood. Some run amps with HTs which seems sensible. The only thing I really know about hi-power is from babysitting some 5 and 10 kw broadcast stations.

I am also not going to slam you or anything else about freebanding. Given the way CB developed it was damned near inevitable. As you respect the 28 line, or at least know what it is, no huhu there either.

But you seem to have an investment in a picture of the amateur community that from my experience is flat wrong. I would ask you why the most popular hf rigs on the market typically run 100-200 watts which is far in excess of the drive requirements of any linear including the GG class B which almost goes out of its way to waste drive power. Having an automatic antenna tuner is a bit of overkill if all it sees is the input of an amp. There is sure no evidence from the gear that power is universal.

Power on the ham bands tends to be inverse to frequency: There is more heat between 3.75 and 4.0 MHz than anywhere else. It tends to be popular on 20 for the same reason it is popular on CB: lots of stations in a little space. But on 15, the WARC bands, and certainly 10 it drops off rapidly. The 10.1 MHz band is limited to 200 watts. As I am too young at 57 for 75 meters, my operations have tended to be on bands where the same investment in the antenna structure pays far higher dividends than the investment in an amp.

Being a cheapskate and liking antennas anyway, guess where my spare cash went???

Top band is a special case. For many years power was limited in the 1.8-2.0 band (160 meters) so most of the classic amps were 80 thru 10. Still are in a number of cases because where 3 to 30 is feasible if difficult, 1.8 thru 30 is not possible without mucho dinero. A lot of the power on 160 is homebrew. As you probably know, it is the multiband nature of Amateur Radio that makes the equipment a lot different from single-band CB gear. Of more recent years, digital modes have made some demands on hardware for no better reason than it is continuous carrier, essentially FM. Using PSK31 for example one will learn about heat dissipation in a hell of a hurry. Those playing with Antique Modulation on CB will be right at home.

While there might be some who fire up a kw to hit the local repeater, they are few and far between. I have worked Argentinians at 5kw on 6 meters but no American even running the 1.5 or anywhere near it. When the propagation gods smile, it does not take heat; when they frown, there isn't enough heat in the world.

Twist, I just don't think the evidence supports your case. That's all.

Hey, I plugged my radio into a 100 watt amp and when I drive through certain neighborhoods the garage doors start opening. I left my radio on while I was having a couple of drinks and the TV in the bar had a lot of interference. I went out to my 18 and shut the radio off and the TV was fine after that. Since I wasn't broadcasting, this makes no sense to me. I am not an E-freak, however, anybody got an answer?

There is in the Amateur community a long-standing ethos about operation within the rules. It has led to some of the most incredible seabag-lawyering known to man and to at least one FCC guy of my acquaintance from my broadcast days. He couldn't believe it either. There is the classic story of a repeater group somewhere in the mountains of Idaho which found that it could not do what it needed to do within the power limits on repeaters, based on HAAT or height above average terrain, and filed for permission against the advice of everyone including the local FCC office which told them to do it, shut up, and if anyone complains we'll let you know. They were the exception in regulations that of necessity were designed to keep someone from blanketing NYC from a hill in New Hampshire. No one gave a rat's ass about raising the rf absorption of a bunch of mountain goats and the increased coverage served some sort of reasonable local purpose. But no, they had to be legal and given the problems inherent in writing regs that allowed one to pump rf over mountain goats but not people, the Commission simply denied the request.

Apparently that part rubs off, damfino. I do not understand the attitude. Yes, the ham bands are generally pretty well self-policed although probably not as well as a few decades ago. Idiocy abounds as in the SoCal repeater

wars and some digital/SSTV conflicts with their neighbors. Anyone around for the AM/SSB wars can remember when 14.205 (the low end of the US phone band in those days, all AM, and known as Kilowatt Alley) made the bowl sound peaceful and serene. The 3.9-4.0 segment of 75 that is not Amateur outside of the Americas has been a cesspool longer than I am old. Riley could spend his life there. He would have to spend some time on two meters as well. Moons ago, I was the pres of a club in St. Louis that thru some interesting wheeling and dealing got a functioning 110 watt GE repeater intact with outside heated case and all off the courthouse in an Illinois county. For some period, I owned the duplexers. We put up a machine designed to be talked on with processed audio and a patch that could decode anything from audibility to square wave. The entrenched powers were none too happy with us, a rather strack organization which were most certainly not. Seems they were unhappy that when our 146.85 machine when their .97 was up came thru on their .91 machine. When it was all said and done, they got a dramatic reading of the riot act and a lesson in how old Micors could be the world's largest broadband mixers (power was always on) without proper antenna isolation. I had a 7805 oscillate with rather interesting results so there is no big Red S on my sweatshirt either. These things can and do get out of hand.

Our club was in general people who made their living and reputations outside of Amateur radio or radio in general, had a far higher proportion of Advanced and Extra than any club in the area, and generally did not take things all that seriously. We had a non-existent call sign for use by the bread-and-milk wives; they were all Sally (imagine telling YOUR wife she had to take a code test) so we too tended to believe rules were to be tactfully disregarded, key word tactfully.

Perhaps the key is where one gets his identity and sense of achievement and, of course, a little ego-boo. The gung-ho shall inherit the earth; God knows they deserve it.

Sorry, but there are so many questions directed at me that I thought I'd centralize theme here instead of making people look all over the newsgroup. Also I have no need to answer some of the more ignorant personal attacks. Their message reflects poorly on their owners.

Okay, first up is Stervarino. He says I am Mark Fuller In Disguise. Sterve, I researched Mark Fuller's posts and it is obvious that he took a lot of abuse in this newsgroup for posing the same kinds of questions. I see you are a ham who is not concerned that illegal CB operations have been slowly expanding upward in frequency. It is no longer uncommon or rare to hear truckers and other AM CBers in the 10 meter CW band. Now the only reason I can think of why you might condone this kind of activity is that maybe you make money selling this stuff to CBers. I could be wrong.

In a later post Sterve denies that there is any CB problem. Please Sterve, just look here in this NG at the thread entitled "neighbor bleeds on phones and stereos". If that doesn't convince you, ask yourself if the mountain of letters and complaints from Vernon Ehlers constituents were imaginary or if they were in fact real people being victimized by CBers.

Wild Bill accuses me of spreading incorrect information about illegal amp makers. Bill, I don't understand. If "the FCC don't care" as you guys say, and "no one is gonna enforce the rules" as you guys are fond of saying, then why should DaveMade, XForce, NoName, SkullCracka, etc. be in hiding? Why don't they post big fat photos of themselves on the web along with an 800 number that says CALL ME FOR ILLEGAL AMPS. I don't get it. If they're not worried, why hide?

Fingerbang wants me to stop. because he says responses to my posts have been less than stellar. Not true, only a portion of responses have been attacks on me. There are quite a few proponents of legal CB in the newsgroup as well. Do you want them to go away, too?

Twistedhead says (in essence) there are much worse crimes than CB rule violations and so that justifies doing whatever he wants on CB. (Sigh) Twist, you are incorrigible. Others have made much more eleoquent arguments than I on the subject of personal responsibility. I will leave you to read them.

Lastly I am asked what is it I want. It's simple. Someday I want to turn on my CB radio and not hear overpowered bullies victimizing other CB users "because they can".

Sincerely,
Aaron H. Voobner, FLRC

> month of December and multiplied that figure times twelve. If you are
> asking me for a link, do your own homework. Let me know what figure you
> arrive at.

You still have not stated "for the record" your source of data. You would like me to believe it is the FCC, but you stop short of stating so. Why? Are you really sure you have the complete list of enforcement actions taken for the month of December?

> Your hammie bands are in way more danger, due to spectrum auctions and
> other miscellaneous obstructions, of getting the ax, long before 11
> meter is going anywhere. The writing has been on the wall since the
> seventies, only now it is covered with graffiti.

Actually with the 40 channels on the H.F. 11m band, the 14 channels on the UHF FRS band, and now the 5 VHF MURS channels, all lumped together as "CB Radio" under Part 95, you CB operators are in the same boat too. So just wait when some of your fellow CBers find out they like operating on the V/UHF bands also, and the 11m group tells them their bands don't matter. It is going to get interesting because you CBers are going to have to deal with the same issues among yourselves as we Hams have had to deal with for the past 80 years. That will be fun to watch.

> Cell phone analogy? Ok! Walking and chewing gum. Some can, some can't.
> Since some people are incapable of driving and talking, lets ban it for
> everyone. Theres that Jeckyll/Hyde thing again..or am I mistaken? Was
> your position on the cell phone law banning them pro or con?

I have not made up my mind on the issue as of yet. I do admit I have been cut off by more than a few mobile cell phone users however. What I was pointing out, on another news group, there is hard scientific studies that support the point of view that cell phone use while driving has serious safety issues that need to be addressed. The others on that news group said no way. Well our elected officials have used the studies I mentioned as a solid basis to pass laws restricting mobile cell phone use. They are no longer laughing at the idea that laws banning mobile cell phone use would ever be passed. The unthinkable can happen.

> FRS and MURS, already good mods and power exceeding legal limits. They
> gave us more freqs to play with and you're pissed over it, which is why
> you even brought it up, attempting to create a tie-in somehow with the
> new regulations passed.

I'm not pissed, but the people in the GMRS sure are about some of "their frequencies" being turned over for "CB Radio" use! Don't believe me, check out some of the comments filed with the FCC, or just search the Internet.

It is also interesting that you NOW claim there are mod's for FRS radios, and MURS too. You also say that people are using above legal limit power too? Wow! That is truly an amazing turn from what I have been hearing from others on this news group. You just admitted that FRS, and soon MURS will turn out just like 11m has, a big cesspool of illegal operations. Funny I remember bringing that point up before, and was told that was not going to happen. Humm... things do change, and the truth will finally be told, and by a CBer of all people. Thanks Twisted, there is hope for you yet.

> The only tie-in that may exist is they probably
> gave us those to alleviate the 11 meter band a bit. Hell, at least they
> are attempting to HELP us!

The only help the FCC provided was creating a set of channels where people can do what the 11m band originally was meant to provide, a short range communication service for use by the general public, and business. Instead it degenerated in to a cesspool of foul language, and all manner of illegal operations 24x7.

> I'm not uncomfortable with anything, Leland.

Sure you are. You just wish that those postings about FCC enforcement action. agaisnt CBers would just disappear along with any mention of illegal operations. It readly does not make any difference who posted the information, the action was taken by the FCC, not the poster. You hear bad news, and you want to shoot the messanger that brought it. Many people have done that, and it does not change the fact it happened.

> I can't dismiss anything by the troll you refer, 'cause I CAN'T SEE IT!

I can believe that. As long as you have it in your head it's a troll you will never open your mind to new ideas, and new understandings.

> posts when you attempt to use a chainsaw to vasectomize yourself by
> referring to it.

When the discussion gets to the point where you use language like the above I realize you are no longer thinking in a rational manner. Or you just want to distract me from the main point.

> I saw enough to know that anyone that aligns himself
> with it is a troll, no matter what it posts now.

You would like to think I have aligned myself with N8 because that would make it easy for you to dismiss what you read, and thus you don't have to think about it, and be bothered by the ideas you would find there in. In other words it gives you an excuse to stick you head in the sand so to speak, hope the issue goes away by itself, and not have to deal with it.

> It's credibility, as yours will probably soon be, is shot, even if it may
happen to
> be correct (which it never was).

I will give you a hint, credibility was never an issue with me. This is something that you have invented, and tried to elevate above the true issues, so you can distract, and sidetrack the points being made.

Twist, if you are referring to the Prescott AZ caper, it involved testees modifying CSCEs (credits from previous tests) beyond the 365 day limit. The test session itself was not under suspicion. In my VE days, we would have taken the CSCE at face and included them for audit in the test report. Seems that is what they did. The system does work.

Besides, if a vertical has been built as a vertical - according to RF theory, that is, it works the same as any other vertical built according to the same theory. Real simple. Of course, Cbers sometimes buy antennas based on different judgement than hams. What's the point in buying expensive tubes of aluminium instead of building an antenna yourself? That's how I got started. 73, Gary

1999. MOVIE: Vertical Limit

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.cb,alt.radio.scanner.flame_fest,rec.radio.shortwave

It seems that there are a few Hollywood screenwriters that are hams trying to hang on to the past.

I saw the movie "Vertical Limit" last night. There's a scene where the climbing party, after surviving an avalanche, is trapped in a mountain cave with a broken radio. They use morse code by keying the mic button on and off, communicating to base camp that they are okay. The dialog goes something like, "Dad taught us morse code when we were kids. He said it might save our life some day".

Maybe at one time, but today, only in a cheesy Hollywood movie.

So I'm going to ruin this movie: The girl, her brother, and a nurse that's part of the rescue party, are the only survivors. Scott Glenn's character saves everyone by cutting himself and the billionare asshole (played by Bill Paxton) loose, when too many people are hanging on one line, and the cam won't hold the weight. Glenn's character planned to kill the billionare anyway, since he felt that the billinare was responsible for his wife's death four years earlier, in a previous climbing expedition. After this act of self-sacrifice/revenge, they all live happily ever after.

There. I saved everyone the price of a ticket.

Come back in 5 years when the sunspot cycle is at a low.
CB comes and goes in 11 year cycles. It also cycles to
high and low activity in 6 month cycles. Maybe you can
make the connections as to the reasons why.

Here's a hint: when the skip is low, less power is used
because less power is needed to talk more then five or
ten miles. I've been on the CB since 1977. Did you get
yours for Christmas 1999? Your Kraco must have been a
stocking stuffer. Remember that most hams cut their
teeth on CB. When they get tired of CB, they get their
ticket. When they get tired of that, they come back to CB.

Tonight is net night for our local CB SSB club. We have
about a 50/50 mix of CB'ers and dual operators. Some talk
about meeting on other bands after the net. That's fine
with me. Us single banders can use the channel to talk
to each other with less interruptions, since half the
channel goes to 10 or 6 or 2 meters! If you don't like
what you're hearing, hurry up and pass the test. If I
don't like what I'm hearing, I change the channel or
turn it off. Those knobs are on my TRC-451. It works
real good for a radio that was in somebody's junk box!

Scott,
I just finished looking at the FCC home page, and
can't find anything about reallocation of amateur band
frequencies. Most of the 'new' allocations are above
24 GHZ, and only one was in an amateur band at all.
That was in the 'chunk' taken out of the 220 band a
number of years ago, and never utilized. If you want
to 'believe' in ol'Wayne, be my guest. But I'd do so
with a large 'grain of salt'.

aaron, Yes i am accusing you of spreading false information of which can end in legal issue for you if it continues . The people you mentioned that are so called selling amps building them selling cocaine etc etc are farther from the truth than you can ever know. And by you accusing these people falsely by either rumour or whatever means you used to gather your information, this information is unfounded and untrue and is pure bullshit speculation on your part which shows how much and or how little you actually do know. Don't accuse me and put words in my mouth I never said in any of my posts the FCC doesnt care, or no one is gonna enforce the rules etc, again pure bs on your part. Why should they post there pictures on any web site what will that do sell more amps . Better Yet why not post your picture on the web so I can print it out and wipe my ass with it. Do you think these people are stupid di you think they dont know amps are illegal . Why are you hiding

Thank you for that post! You have finally put into words some of what I have been feeling but neglected to mention. I, for one, have not seen the necessity for morse in quite a while, but, after dropping my extra license, 1st phone and telegraph tickets back in the early '80s, I was amazed at the 'test' when I decided to regain my tickets in 1993. Heck, I didn't even bother with the resonant frequency problems - didn't want to extract square roots by hand and didn't bring a calculator (don't ask about my slipstick - lost that in the '70s). Since you only need a passing score, I just marked off a bunch of answers to finish the test. The CW test was a joke. Multiple guess. On the GROL, I found out there was no extra charge to test for the (what is it? GMDSS?) maritime distress signalling whatchamacallit so I took it. They apologized profusely - I failed that GMD thingy by one question - and I know absolutely ZILCH about it! Yep, true story. So I settled for the GROL and extra. As far as some of the codeless techs posting to the ng - my suggestion to them would be either QRT or ZBM2. Thanks again for a most interesting (and true) post.

It is the characteristic impedance of the coax.

Total nonsense. Coax length does NOT affect SWR.

Even if you didn't do your homework, you can use any length of coax
you want.

snip
>why do the antenna manufacturers reccomend an 18 ' length.
snip

18 feet is a good choice.

To just name a few. Firestik, K-40, Wilson,and Antenna Specialist recommend an 18 foot length of coax. Others manufacturers either don't use an 18 foot length, or have no recommendation at all.

Some on this group will tell you to use any length, or use the shortest length possible. The only problem with this is that it is based on having no benefit to you other than the cost of the coax, or the convenience of having no excess coax length to deal with.

If you are asking for a coax length to use in the first place then I assume that you are going to get the diagonals out and cut a piece. If so what would you end up with if you used the shortest length possible? Assume a 8 foot length of RG58. RG58 has a power loss of 3.17% at this length. Now choose an 18 foot section of RG58. RG58 at this length has a power loss of 7.15%. The difference between the two choices is about .19db or for a four watt signal you loose .16 watts. No one will ever be able to notice this difference at all. Moral of the story?.............There is no performance benefit in using the 8 foot length.

Conclusion: If you are operating without problems, and are using an existing length of mobile coax that is not 18 feet then don't worry about it. However if you are starting from scratch, and want to use the best choice, then go with the 18 foot length.

Here are some web sights that recommend 18 feet. Some even explain why.

I don't know much about CBs but I had one in my car 20 years ago.
Don't people cut the limiter circuit and turn up the outputs so you
can be louder?
(peak and tune) as the CB shops call it. This overdrives the radio
and causes splatter and harmonics to get out of hand. Amplify that and
you have trouble. A earlier post asked if he has a fiberglass antenna.
Yes he does. He told me it is a Antron. That could be compounding the
problem if it's a known bleeder.
Lived next to a ham years ago. I never had any trouble with his
radios. He was retired and spend a lot of time on it too. I think it
was the 4mhz area he liked.
My neighbor was silent last night. Guess enough neighbors complained
to take it serious. I know one was going to talk with him this last
weekend.

Only if the velocity facter were 1.0. This is almost certainly not the
case.

> Have you heard someone say "I adjusted my SWRs by adding/subtracting coax"

Only someone who doesn't know what he is talking about.

> They really did not adjust the SWR, they simply picked a length of coax
> that transformed the actual load to a 50 ohm load that allowed the SWR
> meter to see 50 ohms and indicate 1:1.

There is NO length of 50 ohm coax that will transform an non-50 ohm load
into 50 ohms. It simply cannot be done!

> Take the earlier case of the 1/4 wave length with a short looking open,
> obviously I can adjust the length to a 50 ohm point and have 1:1 on a
> piece of shorted coax.

Total nonsense. This is impossible. I guess you can spin straw into
gold, too.

> SWR means nothing except that a conjunctive match allows the greatest
> transfer of power.

It is a "conjugate" match.

SWR certainly does mean something! A conjugate match with a high SWR
will have higher losses than a conjugate match with a low SWR.
Furthermore, most CBs do not provide any mechanism for creating a
conjugate match to a non-50 ohm load. Thus, you must have a 50 ohm
load for a conjugate match. That is, you must have an SWR close
to 1:1 for a conjugate match and the highest transfer of power.

> In short SWR's are the source of more myths and urban legends than the
> internet ;>}

Yeah. And you keep spreading them!

And I don't doubt you in any way whatsoever, Jerry. As the ops go..those that do and those that don't......in both services. I know what the hams around me run, some are my buds, others aren't, as you say, there are many who don't, there are probably just as many that do. I don't have a number and I wouldn't venture to guesstimate. I can give you a good example of lower band useage, though. If I'm sitting at the beach in my truck with the bowl on, or, lets say 38 lsb for the sake of it to take away any issues of running power for the moment, and one of my local hammies (who I and others in the area thought was a good decent op until we found him on another CB channel bragging about his power of shutting us all down on our local freq) blasts through the bands all the way from 10, I don't go up to his freq and plug his ears, or start junk with him, even though I very easily could. I switch the band down a notch, and the lower I go the less I hear until he is gone. Off topic a bit, but to reiterate, yea, there are those who do and those who don't. The ones 'round here like power, and I don't have a problem with it...unless they start a pissing contest, or, like the hammies would have a legitimate gripe if a cber went to 10, he comes down to the cb band starting a problem. I have no problem talking to anyone, hammie or not, on the cb band, and I could care less what they are running. If I can hear you, I will talk to you.

Total nonsense. It does no such thing. There is no length of 50 ohm
coax that will transform 37 ohms into 50 ohms.

Thanks
Logging is the next step I guess. Tried ferrite RF chokes on the
speaker wires and power cable. Bought a surge protector with RFI
filter built in too.They cut the interference down some. Half as loud.
Got two filters from the phone company. Don't know yet if they work.
Going to start monitoring when he talks using a shortwave receiver.
He was quiet last night.

Chas

If enough neighbors complain I think some action will be taken. A simple warning may do it. Don't wish to see anyone fined unless they don't cooperate.

Chas

All twelve of us. The only reason I showed up on 11 was with another high school student doing some fiddling with A4 which was only legal on 11 meters and ran about 55 watts to an old John Meck T-60. A kw was certainly legal but one had to put up with people with torches and nooses on his front lawn. Even in the days leading up to the greatest sunspot cycle of all time, the band was pretty dead.

The video if was 26.75, the sound was 21.25 in the old sets. On some of them 10 meters took courage.

We can agree to disagree but I still think the 4 watt limit sewed the seeds of its own downfall.

Dick N&#65533;BK, first licensed November 1954.

Total nonsense. There is no reason to use 18 feet.

> To just name a few. Firestik, K-40, Wilson,and Antenna Specialist
> recommend an 18 foot length of coax. Others manufacturers either
> don't use an 18 foot length, or have no recommendation at all.

I have only seen Firestik recommend 18 feet. I attempted to
get them to justify that recommendation and all I got was a
cheap personal attack. There is no justification for 18'.

> Some on this group will tell you to use any length, or use the
> shortest length possible. The only problem with this is that it
> is based on having no benefit to you other than the cost of the

> watts. No one will ever be able to notice this difference at all.
> Moral of the story?.............There is no performance benefit in
> using the 8 foot length.

You are contradicting yourself. You said there is a 0.19 dB benefit;
then, you said there is no benefit. I admit it is a trivial benefit
but it is there. There are NO advantages of using 18 feet over 8 feet.

> Conclusion: If you are operating without problems, and are using an
> existing length of mobile coax that is not 18 feet then don't worry
> about it. However if you are starting from scratch, and want to use
> the best choice, then go with the 18 foot length.

There is no reason to use 18'. You have provided no justification
that it is the "best choice."

> Here are some web sights that recommend 18 feet. Some even explain
> why.
>
>
> http://www.firestik.com/FAQ.htm

These Firestik guys don't know what they are talking about.

> http://www.wilsonantenna.com/swrf.htm

This site parrots the Firestik site. Obviously, plagiarized or
written by the same guy.

> http://www.wilsonantenna.com/coax.htm

Same as above.

> http://64.70.218.95/k40cb/CBfaq.htm#What

I can't believe the myths on these pages! They are a true
disservice to CB radio. Not only do they carry the coax length
myths, they also propagate the myth that rolling your coax in
a loop makes an RF choke. It does no such thing to the signal
within the coax.

What Radio out there is not illegal? If it was so bad they would take sites off of the internet that tells you how to do it. Like they did with the pipe bomb that was used in Colorado.

Both are a neighborhood nuisance.
The CBer for bleeding on home electronics.
Sure the drug dealer would be a higher priority but I don't want the
illegal amps bombarding my phone and stereo either.

CB Illegal amps are cheap made. Without proper shielding, and
filtering, it amplifies a signal from a modified radio (peaked and
tuned) not outputting a clean signal.
I bet half or more of the extra power a peaked and tuned radio puts
out is splattered into the channels above and below the one your
talking on. Harmonics go up to. That causes interference with TVs.The
bandwidth filter can't handle more than 4 watts. Wasn't designed to.
Then the cheap amp multiples the problem.
All electronic gear have to meet FFC interference rules. Even TVs,
stereos and computers. Look at the manuals for your home electronic
gear. Black market amps don't do this. Neither do modified radios.

REQUEST FOR DISCUSSION (RFD)
unmoderated group rec.radio.cb.dxclubs

This is a formal Request For Discussion (RFD) for the creation of a world-wide unmoderated Usenet newsgroup rec.radio.cb.dxclubs. This is not a Call for Votes (CFV); you cannot vote at this time. Procedural details are below.

Newsgroup line:
rec.radio.cb.dxclubs Sky wave propagation on 27mhz.

RATIONALE: rec.radio.cb.dxclubs

rec.radio.cb.dxclubs will create a Usenet forum for the discussion of the popular hobby of long distance communications performed during periods of solar storms and the aurora.

CHARTER: rec.radio.cb.dxclubs

rec.radio.cb.dxclubs is for the sharing of news and member information of established and new radio dx groups.

END CHARTER.

PROCEDURE:

This is a request for discussion, not a call for votes. In this phase of the process, any potential problems with the proposed newsgroups should be raised and resolved. The discussion period will continue for a minimum of 21 days (starting when the first RFD for this proposal is posted to news.announce.newsgroups), after which a Call For Votes (CFV) may be posted by a neutral vote taker if the discussion warrants it. Please do not attempt to vote until this happens.

All discussion of the proposal should be posted to news.groups.

This RFD attempts to comply fully with the Usenet newsgroup creation guidelines outlined in "How to Create a New Usenet Newsgroup" and "How to Format and Submit a New Group Proposal". Please refer to these documents (available in news.announce.newgroups) if you have any questions about the process.

DISTRIBUTION:

news.announce.newgroups

I will respond to some of your points. Please, fellas, don't get mad because what I say is my own opinion and not meant to flame, heckle, or harass anyone.

>
> To justify the means? What justification does a person need to explain in
> his or her activities? To run illegal CB radio equipment is that
> individuals "CHOICE."

Indeed. But one should be aware of and take responsibility FOR his actions.

If anyone should take that Freedom of Choice away
> from any one person is guilty of being a downright COMMUNIST.

That is why the laws are there. If one group has the "choice" to operate with huge amount of power, or on frequencies he/she is not assigned, what happens to the "choice" of the person, group, or organi-zation who may be *bound* to that frequency due to their own licenses or equipment restrictions?
>
> Now take for instance myself, ONE37, running a 50Kw splatterbox (which I
> cannot afford on a Military man's salary) of unknown proportion talking to,
> lets say, a guy in NYC on 27.025. Illegal as all of hell under now State
> and FCC regulations and pursued with vengeance and malice. Why?

Because CB was never meant to be a "hobby" operation. It was designed to have LOW power to prevent interference to consumer devices (as much as possible) and to lessen the effects of the band's own propagation characteristics. The current deal about going after operators who in-terfere with Mrs. Jones TV with excessive power or "modded" radios came about due to complaints to Congressmen from consumers, not from hams. The fact is, the situation with illegal radios and ever-increasing power has been escalating for years. IMO, as more people were able to "get away" with it, the more the same folks told newcomers, Hey, this is the way to do it, and, We found these "quiet" *channels* down below channel 1. It created a market for channel expanders, mods, and higher and high er powered radios. Of course, this couldn't help but increase the in-terference to other consumers and other radio services, as well.. FCC's funding had been reduced, and after the huge CB boom of the 70s, sim-ply couldn't keep up. That created the atmosphere of, "They can't do anything about it". Due to the great number of illegal operators, the increasing amount of interference, it created a backlash within the non-radio community who don't care a whit about radio, but only want to watch Monday Night Football without having the TV swamped by a CBer down the street--or even a ham for that matter. It took several years

for the local enforcement thing to get passed, but it did pass. Mainly because of a few who mess it up for all.

>
> Is it now that we are looking for a justifiable necessity to blast a
> harmless entity???
No! The result of the "illegality" issue came about because of a few who run Mega-watts, operate radios that have been peaked, "clipped", and otherwised "boogered" up so that they no longer operate within the design specs. Such equipment *will* create extra wide signals and harmonics that find their way into other equipment that was not designed to accept such "spurs" and power. Of course, I think consumer electronics should be better filtered to reject, at least, some of the products generated. But it is difficult to amelioriate very high power nearby which can "swamp" or paralyze a receiver. Anyway, there must be a kind of happy medium that allows everybody to enjoy whatever sort of electronics they choose whether it be a TV, stereo, PA amp, or a two way radio.

We sure can clean up the airwaves but we can't clean up
> our sense of morality, our sense of values, our sense of ethics??? Is it
> because its easier??? A scapegoat for fear of offending??? Justify this
> please.
>
> My justification for the Illegal OP is simple. It is fun, it is harmless.
Taken within the entire scope of illegal radio activity which includes running those modded rigs, amps, and freebanding, it is NOT harmless. I would have no problem with CBers having more power than allowed now, but I am only one and cannot help the restrictions that exist. One of the troubles with the CB amps is that a lot of them are not well filtered and/or designed to prevent harmonics. The builders are only going to do so much, the less put into them-the more profit made, and likely just don't care. Again, such amps cause spurious emissions that create mischief for other people, groups, and radio services.

Freebanding. I am sure that this practice got started when someone listened above/below the CB band, or swapped their crystals around in the old rock-bound days. Hearing no activity, the assumption was made that this area was "free" or unassigned. I can see how, having been accustomed to the constant chatter on CB, an untrained operator could conclude that nobody used this area. What we are talking about in these areas are forestry, forest products, itinerant, and military frequencies. True, you don't hear much, and what you *DO* hear is likely to be pulse generations, digital comms, and, rarely, voice. A lot of the "freeband" spectrum is not even under the FCC's jurisdiction. That's why there is not anywhere for the current CB band to expand. However, whichever agency assigns bandwidth there, they do not require that the receiving entity use said freqs. a certain amount of time. NOW! Let's say a CBer (or even an illegal ham) gets on the "freeband" with a modified radio and a dirty amp. Now, said amp is putting out a 4th harmonic. 27.965 X 4=111.86 MHZ----right in the middle of the aviation navaids.

Tell me how creating a dangerous situation for an airliner or even a small plane is "harmless"? It could only take just once to cause the loss of hundreds of lives. What if one of *YOUR* relatives was aboard that plane? Would it be "harmless" then? You see, that is the part that the average citizen is not aware of. Without some other knowledge or training as to the whys, hows, and wherefore's, most of us aren't equipped to make an accurate decision as to what is harmless or not. That is NOT to say that people are stupid, it just means that *most* of us are not privy to the training necessary to decide if what we do is OK where radio is concerned. The laws are not perfect, to be sure, and can sometimes be changed to meet current needs or demands as technology changes. The laws that make certain kinds of radio operation illegal are not there just to hinder, but they are there to meet operational needs and the need for safety as it pertains to lives and property. Thusly, lines are drawn--and they may not meet *everybodys* wants---, and again, not always perfectly, to allow as much freedom of action as possible for as many radio services as possible.

>

and it is with accord of a sense to spread the goodwill to all who wish to
> be communicable.

The "goodwill" gets lost in the fray when someone's operating ability, or someone's life, is lost because of those who choose to disobey laws. Again, these laws may not be perfect, or acceptable to everyone, but they are there to protect the rights of as many as possible and, actually, to *facilitate* the convenience or neccesity of radio communications for all.

But since the law
> written by the hams, of the hams, "for the people" (FCC Reg Title 47 CFR
> PART 95 Subpart D Citizens Band (CB) Radio Service) for governing bandwidth
> HAMs did not want in the first place (now are trying to take back),
1. Ham Radio is governed by a set of regulations put in place by FCC and international treaties. Hams, tho some regulatory agents may *BE* hams, do not control the laws governing CB (and shouldn't be bitchin' in the newsgroup, i.e. making inflammatory posts and insults).

2. Amateurs are *not* trying to take 11 meters back. That was a rumor spread on the newsgroup to flame, and get stuff started. Ten meters is quite adequate.
>
Does it really break your heart to hear a little bit of QRM
> from 27.085, 27.025 and 26.915? They are within their assigned frequencies.
Some QRM is inevitable anytime a band is subject to maximum use. Incidentally, 26.915 is not within "assigned" frequencies for CB. Channel 1 is 26.965. Maybe you made a typo. No quarrel with QRM. Yet much QRM is caused by huge amps, modded radios, and uncaring ops.

> Now for freebanders, well, malicious interference with an intent to cause
> disturbance to the Amateur Radio Service is pursuable. Triangulate there
> postion and take them down.
Agreed. As well as hams who operate illegally and cause deliberate
QRM to other hams AND CBers.

But not here on this NG.
Agreed.

A majority of the
> people here are legally operating within the PART 95 parameters. Don't bash
> them all... Ham and CBer.
Absolutely!
>
Sorry I got a little
> longwinded, but damn, let the bashing end.

Agreed. I am ashamed of those who come in and constantly bait and
insult people with slanderous, libelous, statements which only cause
all of us grief. Now I have posted some info here in this message that
will, likely, not be agreed with by all. However, to those, who disa-
gree, I only ask that you examine this post and, I am sure, you will
find nothing that is directed to any one individual, nor will you find
anything derogatory. It is an OPINION which is based upon facts and
my own experiences in 35+ years of radio (which includes CB). I only
ask that, while you are most welcome to disagree, you respect my opinion
as I have respected yours in the past.

Most respectful 73,

Jerry

Fred,

But! You would do much better with a resonant antenna in place of
a "tuner". The tuner does the same thing that that "flawed" coax
you spoke of does. YOu still have a mismatched antenna.

Jerry

Have you ever noticed that Hollywood never gets anything about any radio
correct?
With the possible exception of "Sink The Bismark", where a "spy" simply sent a
CW message every other instance is unlikley at best.
Die Hard #1...What are the chances that the "bad guys" would operate on teh
same frequency as the local pd. Or even "The Man From U.N.C.L.E"'s little ink
pen transceiver. Yea, open channel D please. Just what type batteries fit in
it and what frequency did it operate on so that no matter where our guys
where, from the middle of a desert to the bottom of a mine shaft they could
reach HQ.
As a general rule, everything TV or HW produces with a radio is garbage.
But then almost everything they produce is garbage.

2052. Installations on ATV's

I have an expensive amp for 11 meters is that one ok? it is type accepted
for the ham bands in fact I picked it up at one of your local Ham fests
thats right I bought this purdy 11 meter / hambo amp at a good old pencil
pocket protector, hush puppie wearing black plastic eyeglasses with the tape
in the middle wearing Ham fest Thats right them there boys with licenses
were selling them by the car load(actually make that station wagon load)
right in front of all the other hambos and they didnt seem to have a problem
with it Well i know old Riley even had a field day at the Dayton fest where
there were more illegal amps than the Carters got liver pills. go clean up
your own mess

I personally run CB generally from my car. This way, I hardly ever interfere with my neighbors. I had an A*#hole neighbor who ruined my tv. phone, etc on a constant basis. After asking him nice to power down during peak tv hours, and him not doing so, he eventually "ruined" his rig by transmitting into a shorted piece of coax.

If someone is being an ass, call the police. If that doesn't work, defend yourself. It is SO easy to stop illegal radiation.

Source record: 63437

I think sometimes that the real problem is the way "the radio laws" were made and are currently enforced. I think the original poster's intention is to point out that breaking "the law" isn't considered wrong by many people because a lot of the times "the law" is perceived as being wrong!

If "they" passed a law that said you weren't allowed to breath, some folks would accuse you of being a criminal just as soon as you took a breath. If this is justifying criminal activity, then I guess most of us are "criminals" in somebody's book somewhere. Crazy example I know, but just think about all the unreasonable laws you know of. I doubt anyone agrees with every law that is passed by their local or federal government and just goes along with it.

Have you ever been caught for speeding? Have you ever not reported income on you taxes? The list is endless. Sure, we can all join in the political process, vote, protest etc. That's a great idea. Some of us do that. Some abide by most of the laws and work within the legal process to get unfair ones changed. Many don't! (probably most of us). Some people realize that big brother has just gotten so big that he can't handle enforcing all the laws he's created. Now ain't that a shame? Come on now, who is really a criminal, an illegal Cber or a drug dealer? Depends on your standard of reference or definition now doesn't it! Where do you draw the line. Drugs? I hope so. Radio regulations? Yeah, well, maybe that ones debatable. Does this mean that I condone randomly breaking any law you don't like? Absolutely not! I am just pointing out where a lot of people are coming from. Be careful who you consider a "criminal". You might should look in the mirror and realize that if you judge yourself by the same type of standards, you could be one also!

I am not a HAM. If it was a ham op next door I would be in there
newsgroup complaining.
If the guy next door didn't run a linear amp I likely would have
never looked up this newsgroup.
I don't think all CBers are bad. Don't take it so hard. I like a
no harm no foul rule.
If your neighbor had his stereo up loud late at night would you tell
him to turn it down? Sure you would. If he didn't turn it down you
would call the police so you could sleep.

That's what I mean, CD. Incorrect posts by these guys that are nullified with correct info and then they change it and refer back to the law issues. You can tell who's new to semi-new to radio among our new crusaders, that's alright, hehe what a wakeup call they got comin' when they actually realize no one cares and it's been this way for quite awhile!

So what, then don't turn that dial to that band there are plenty more. Its like going to a bad neighborhood you know that trouble may lie ahead and you enter at your own risk except no one is going to get killed or mugged I don't condone all the activites that go on 11 meters If you live out away from people and are no harm to a neighbor I say So what run a few extra watts I don't like the freebanders going on 10 meters If they contain themselves to certain set of freqs not infringe upon others right to peace in there own home void of interference then they can act like fools all they want it is a non formal radio service where people have a hobby albeit some are rule breakers but certainly I dont call it a criminal act whatsoever It is the same if you speed down the road are you labeled a criminal?
Why not get on the radio in your own area and preach your gospel to the people who may affect your radio Instead you troll on here trying to get the whole world to listen But you really are not interested in helping anyone you are here to be a asshole and cause trouble That is your only goal here.

Here's a topic for a new discussion. If it is true, by what measure is the degree of bleed determined, and what antenna characteristics are most liekly to generate a 'bleeding' antenna? Does the nature/type of the transmitter interact with the antenna to create the 'bleed'?

My own experience on which I claim no particular expertise is that the power line, either indirectly from radiation or directly via a ground loop is the biggest single culprit in this kind of interference. When the neighbor who shares a distribution transformer with you is the complainer, it may be as simple as feeding the transmitter thru a cheater plug and removing the connection between electrical system ground and station ground. I know, we grew up to be 'grounding' freaks but sometimes two is one too many.

If RFI is caused by spurious signals from the transmitter, it is NOT okay for a ham, CBer or even your local police transmitter to cause that kind of RFI.

If it is a case of fundamental overload, the cure can only be applied to the affected device.

Info on RFI can be found at:

The ad I saw suggested that the action was taking place at an altitude of
about 26,000 feet, but also showed helicopters. I didn't think
helicopters could be used at that altitude. ;-) Can anybody tell me if
this is actually true?

I'm waiting for Hollywood to do a movie on the Amiraults, a true story
which probably doesn't fit what Hollywood likes to portray. :-(

I'm having trouble getting my Cobra radio to work. I have a portable magnetic antenna temporarily velcroed to the rear deck lid of my car. The reception is intermittent and the radio just squeals (according to the unfortunate folks who have listened to my transmissions) when I key the mike. I have been reading about different type antennas, but the ones for aluminum and fiberglass bodies can't seemed to be mounted on my Audi A8.

I don't live near a CB shop, so I am trying to figure it out myself. Any help or suggestions would be appreciated.

Aaron,

Your post has been taken into consideration. I, too, have thought about the shear legalities myself. I, too, have also "dibbed and dabbed" into the realm of CB Amplifiers and Super-modified radios. But you have to remember, there is no "Excuse to stay illegal..." its a "CHOICE". I chose to do so. I, myself, have to live with the fact that "yes", I was doing something illegal. But that WAS my choice. And everyone here, illegal or not, has that same right to chose. Now, like Ibrahim quoted... "It's not the illegal operators, it's the irresponsible ones." Let this be a commonality with which we can agree on...

VR,

ONE37

I agree. I believe creation of a newsgroup devoted to 11 meter DX would
attempt to legitimize what is clearly a violation of present FCC
regulations specifically prohibiting such communications and encourage
the proliferation of illegal RF amplifiers and further promote operation
on the so called"freeband" frequencies.

"rec.radio.cb.dxclubs" is, in practice, a euphemism for
"rec.radio.cb.illegal". If you are going to create a newsgroup devoted
to illegal cb radio it should at least bear a title more in keeping with
its content.

Sincerely,
Aaron H. Voobner

It's not ok.
Hams with there ticket at stake are more likely to clean it up when asked. A radio bleeding is a radio bleeding. I don't care who the offender is.
Instead of defending your use of illegal CB power I was hoping the group would have tips on filtering either on my end or the offenders. After looking at the posts here I see that doesn't happen. So I just complained.

You hams and CBers can argue till the cows come home. Instead you should teach each other how to fix these RFI problems that hurt both hobbyist.

This has gotten me nowhere so I will leave your newsgroup.

Bye
Chas

You have probably messed up the connection of the bottom of the antenna to the car. The car is half the antenna. the squeel is probably rf energy being forced into the radio due to messed up radiation pattern. make sure that the bottom of the antenna is flush against the metal. or, buy a different type of antenna. the bottom line is that the
car is 1/2 of your antenna. if there is no connection to the car (generally, unless you're using a 5/8 wave antenna or something)...you got problems.

it has been my experience that you just cant get the bleedover out of
your neighbor's stuff, no matter what you do. especially if you are
running power or a radio that swings more than 4 watts. and thats the
bottom line , no doubt about it. some would say, if you aint bleedin ,
you aint talkin. heck i think the best thing to do is either come to an
agreement with the neighbor somehow, someway, but of utmost importance
is keep the lines of communication open or it could just get worse. if
someone complains about your base station, and is adamant about it, the
best thing to do is get away from the base station thing, get mobile.
you can't tell me, that if a ham or anyone else is pumping 1500 on the
base, you are not going to stop any neighbor within a 1/4 mile of your
location from watching channel 2,......cd is out......

joe,
Instead if velcro, find a magnet (strong) and place it
under the rear deck, under the mag-mount. Should hold it
okay. Aluminum works fine as the 'other' part of the
antenna, just not very well with magnets...

Before wasting your cash on a thousand-watt linear, ask yourself this - who
are you going to be able to talk with on it?
If you can't hear them, you can't talk with them. That will limit any
advantage of that linear to conversations with some other guy who also has one.
And he may well be in Brazil - in Portuguese. Sure, you'll still be able to
talk to the guy a mile away in English - but you hardly need to spend hundreds
on a linear to do that!

If you noticed I said PURPOSED law, I will get a copy as soon as the city fathers put the polishing touches on it and scan it for upload. I take a bit of pride in having written a good portion of it. My concern was to insure that CBers operating within the law had protection, particularly in regards to part 15 devices, stereo, and other audio equipment that was subject to audio rectification. I think that most CBers will find that if they are operating within the law, their local ham interference committee will go to bat for them. Those operating high power, broadbanded signals, and outside the 40 channels will be just as quickly turned in. While many jurisdictions may not want to get involved, those that do will make life less than bearable for renegades. Of real interest in our town is the use of profanity as defined by the FCC is being give the same consideration as any other violation. I had no input in that regard, but apparently one of the ladies in town got cussed with the "F" word by a trucker and they intend to fine violators.

I will keep you informed as to what finally passes.

I'm too poor for Audi A8s, so I don't know much about them - but here are
some suggestions:
Does the car have a steel roof? If so, take the Velcro off that mag mount -
and stick it on the car's roof, snaking the coax in through a seldom-used door
between door and door jamb (many use rear left door for this).
If the car has an aluminum trunk lid, go to a local two-way radio installer
- of the kind who puts two-way radios in patrol cars - and get a
"trunk-lip-mount" antenna. It clamps onto the edge of your trunk lid.

Tried to offer these guys my 148 and all but I guess these guys are pretty
much set in getting Grants. Don't ask me why...

If you go this route, make sure to put a ground strap or two from
the mount to the body. Hinges are not a good RF ground. Even if you
drill the trunk to put a mount in it, use straps.

Buy a "Puddle Jumper" (If you have an A8, you can undoubtedly afford
one) and use that as your radio car. I love CB but I just cannot see
sticking an antenna on that car.
This does not make me a "Bad Man", does it? :-)

: "Sparky" <sparky@cet.com> wrote in message

It means a bit more than that. The Ham will be operating on legal frequencies
and using an amplifier that meets FCC requirements for purity of signal. If
the Ham causes interference on other frequencies, he will hear about it
sooner or later from the volunteer monitors.

Most CBers that run power use amplifiers that do not meed FCC requirements
for signal purity - although some use Ham linears, and are capable of
tuning them properly. Most of those CBers run SSB stations, and rarely
get on AM.

There are many CBers that are good radio operators. Communication with
them is generally very pleasant. There are also a lot of bad operators
who tend to make life miserable for the rest of US.

There are also some Hams that are bad operators, although they generally
tend to be better than the average CBer. This may be due to the monitoring
that occurs - with the chance of losing their license if it is not corrected.

I wouldn't do it. The slippage of the mag mount (from vibration as you drive) atop the trunk lid might scratch the paint.
The trunk lid flexes enough as you drive that a mag mount to anything "under" the trunk lid itself probably won't hold firmly at 60 mph.

I seem to have ruffled some feathers here, but I don't know why. Some of you guys get all jumpy and rush in to try and scare people off if you think the illegal amp makers identities are about to be uncovered. I swear, it's ODD.

If the FCC is not interested in busting the illegal amp makers, then there's no harm in providing their real names and addresses, is there? Furthermore, if the CB laws are a joke that nobody pays attention to and CB enforcement is such a low priority with the FCC, then what's the big worry?

Why don't DaveMade and XForce and all the rest take out full page ads in POPULAR COMMUNICATIONS? You guys could have a party.

Aaron

I normally don't get into battles over nonsense. If you choose to believe that most mobile installations don't fall in the 37 ohm region, far be it from me to try to convince you otherwise. On the other side of the coin with simply an extra class license and a masters in electrical engineering would I ever approach a problem with the complexities of transmission line theory with a simple "nonsense. But! far be it for me to not allow YOU that freedom. I would invite you to engage in private e-mail and I think I can show you your statement is possibly in error. I would ask you what is the impedance at the receiver end if the far end of an 18 foot piece of 50 ohm coax is connected to a 37 ohm load at 27.185 MHz? Assume a velocity factor of .65

Fred:

You won't battle over nonsense but you'll spread it. You made your
inaccurate claim publicly. We should set the record straight publicly.

You gave me your credentials. Now, use all that knowledge endowed
upon you to give me the answer to my question which I insist you cannot:
What length of 50 ohm coax will transform 37 ohms to 50 ohms?

Go ahead. Lay a little complex transmission line theory on me!
I can take it!

Plot it on a Smith Chart and watch your impedance spin round and round
without ever getting any closer to that 50 ohm point in the middle.
Anyone with an MSEE should know that.

Here is the answer to your question (I welcome serious and meaningful
challenges -- we are here to promote understanding and stamp out myths):

An 18 foot piece of 50 ohm coax with a 0.65 velocity factor will
transform a 37 ohm impedance to a 67.1 - j3.8 ohm impedance.
It is no closer to 50 ohms. In fact, the SWR is identical (it has
to be!).

It is called a "transmission line transformer", and is used quite
often.

>> Take the earlier case of the 1/4 wave length with a short looking open,

You obviously have never tried it. It happens because it creates
standing waves along the entire length of the coax. It is commonly
called a "shorted stub".

>> SWR means nothing except that a conjunctive match allows the greatest
>> transfer of power.
>
>It is a "conjugate" match.

>
>> In short SWR's are the source of more myths and urban legends than the
>> internet ;>}

As everyone knows, a dummy load presents a 1:1 match. It doesn't
radiate very well. SWR is a good indicator of impedance mismatch, but
it needs to be measured not only at the radio/coax junction but also
at the coax/antenna junction. And it still is not an accurate measure

of power transfer, because the antenna may have some reactance that the SWR bridge does not detect because of opposing reactance somewhere else in the system. In that case, an SWR of 1.5:1 may radiate better than a 1:1match.

Greetings!

Then please answer why Radio Shack, Francis, Firestik, and the ARRL
recommend using specific lengths of coax for the use of Transmatch.

Then clarify the difference between coax length, and Transmatch - and
how location can directly affect outcome.

An operator that runs power using every consideration for interference
may indeed be responsible _except_ for the fact that he is operating
outside the limits. So for that reason, in conjunction with reasons
that I have previously stated, I don't agree that the operator is
being responsible.

It's not okay for hams to cause interference, but we at least know the limits. Besides, according to radio regulations, we're required to contact the neighbor who suffers from the interference. Simple things like chokes and stubs, hi/lo pass filters often help. No problem. Gary

Neat idea!!! (The magnet below the body!) You'd
just have to pick a point where there were no extra
re-enforcing ribs.

Most mag mount antennas use a 'capacitive coupling'
to the car body, and velcro would give many times the
gap that was originally there, greatly lowering the
coupling. However, that doesn't sound like his
problem. He said his reception was intermittent. I'd
get that issue fixed first!

But I wonder... Velcro? Someone was willing to put
'stick on velcro' on the deck? Why not just drill a
hole for a permanent antenna? Or a trunk lip mount
with a base loaded coil?

Or (shudder) one of the through the glass cellular
lookalikes.

I built a 2M amp one time that had 1W in from my
Kenwood TR-2400 and had 160W out.

One day there was an accident, and I ended up parked
next to the firetruck. Everytime the truck tried to transmit
my amp would click-click-click... And it was wiping
out everything around, and the fire base couldn't make
out what the truck guy was saying.

You COULD be getting interference from something
'outside' the CB system into the amp. It could be picking
up hash from a vehicle computer and amplifying it.

Sounds like a crappy amp. I'd dump it. Seriously, it's
either got something wrong or is a really bad design.
You may find an 'external' cause, but even still, the
amp shouldn't be doing this.

Just remember, you only have so much power (and I'm
NOT referring to a government limit). If your amp is
wasting it's resources on power out of band, that's just
even less you have in band where you want it.

CLEAN power should always be an issue!

It could even be the amp itself, oscillating because it's
unstable. Hey, RS had problems with one of their TV
amps a few years ago. If a customer bought the 300
ohm version, and used unshielded 300 ohm twinlead,
and 'taped' the input and output leads together (to make
the wires look neat up at the antenna (I know, I know,
but some customers did!)) the coupling between the
cables could cause the amp to oscillate, and the
antenna now became a beam transmitter that could
cause interference for miles...

Besides not working worth a glob of snot.

I think the biggest difference is that activity is identified. It is a
whole lot easier to be a dipstick when you are the Velvet Codpiece rather
than KXnXXX. It is the difference between talking about cars and signing
your name at the bottom of a purchase order.

Kind of applies to newsgripe postings as well.

This was one of those Class C jobs where the amp B+ is on all the time and comes up on drive?
Now you know what happens when things come in via the antenna. Amps like this have to have some fairly major isolation hardware between them and the antenna or just what you describe happens all too frequently. The amp isn't dirty, it is just missing the supporting cast.

Give me one example of a tranmission line transformer that uses a
50 ohm transmission line to transform a non-50 ohm load into 50 ohms.
It cannot be done.

Hint: If you place a 50 ohm termination at the end of a 50 ohm
transmission line, what is the input impedance as you vary the
length of the line? Answer: 50 ohms! The 50 ohm impedance is
NEVER transformed to a non-50 ohm impedance.

> called a "shorted stub".

We're not talking about shorted stubs. Regardless, you will never
see 50 ohms at the input of a shorted stub regardless of the stub
length. Give me the length of coax that I need to see 50 ohms at
the input of a shorted stub. You cannot.

> As everyone knows, a dummy load presents a 1:1 match.

Yes, if it is 50 ohms.

> It doesn't
> radiate very well. SWR is a good indicator of impedance mismatch, but
> it needs to be measured not only at the radio/coax junction but also
> at the coax/antenna junction.

Not true. The SWR at both locations is the same.

Keep this in mind. The SWR is, in essence, a measure of the percentage
of reflected power. If the power traveling backward at the antenna
is not equal to the power traveling back at the radio, where did the
power go (or come from). Power must be conserved. It is a basic
law of physics.

> And it still is not an accurate measure
> of power transfer, because the antenna may have some reactance that
> the SWR bridge does not detect because of opposing reactance somewhere
> else in the system. In that case, an SWR of 1.5:1 may radiate better
> than a 1:1match.
>
> Sparky, FLRC

So you are saying that an antenna that radiates 96% of the power works
better than an antenna that radiates 100% of the power.

Firestick doesn't know what they are talking about.

Quote me any of the other references and I'll be glad to address them.

> Then clarify the difference between coax length, and Transmatch - and
> how location can directly affect outcome.

The coax length does affect impedance but not SWR. With a Transmatch,
you create a conjugate match to the coax input impedance. Varying
the coax length will change the coax input impedance and lose
your conjugate match. But it really doesn't matter because you
merely retune the Transmatch to get your conjugate match back.

No particular length of coax is required to use a Transmatch.

In most cicumstances the degree doesn't matter. Example: same radio, stock mic, say, 25 watts. Bleeds (devices in home) like hell on the Antron. Switch to metal antenna, no bleed. Before you ask, yes, both antennas were on the tower (not at the same time), same height. Eliminated cooincidental results by repeated comparisons and radios. Try it with 2 whips in a mobile application with some power and have a portable TV on hand with rabbit ears. Same result. Certainly the transmitter CAN be the culprit, but not always. There are countless conditions that COULD be responsible, but I have found replacing a fiberglass with a metal antenna has ALWAYS (in my instances) reduced bleed when attempting to cure it. When I am asked locally for an opinion on bleedover, the first thing I ask is, "What type antenna you on?" Process of elimination from there.

Do the opposite of those mods to restore the useless feedback
generating talkback. A much more accurate sounding type of
talkback is to use an earphone with another receiver.

That's all cool, Richard. We can see this differently. I don't listen to the hammie bands on the road so I can't say what takes place in other areas. I can only say what happens here with frequent occurence. I too, know of two hammies in close proximity who don't have any power to run. These are the ancients of hams. All the younger (baby boom and down) hammie generation here is blinded by watts out, not giving any respect to the main portion of their station, the antenna. Matter of fact, there is a guy who talks on ten meter around here and nothing else with a damn expensive set-up, and get this, he uses an Antron. Talk about splatter? My God! Same one I mentioned in another post about me in the truck at the beach.
Some of those radios that SAY they do 100-200 out of the box are used just for what you said they exceed, drivers for the big boxes, whether home brewed or not. How many watts does it take to drive JRC's top of the line amp? As you say, I see 'em one way here, and you see 'em another way there. By the way, just where is THERE? You in the midwest?

As I said to Richard, Bill, I can only go by what I see here. And it is the exact opposite of what you describe. Maybe I'm in hammie hell here and don't even know it, except for the occasional bleed.

Greetings!

Ok, I see your point, and here we go again. As far as Radio Shack, take a trip to their store and ask for the manual to their Deluxe Magnetic Mount CB antenna - or any CB antenna that has a pamphlet with the wrap. They are WARNING you not to trim the coax. I'd like to know why, aside from ruining their pretty job of soldering the PL259 end on. ;-) These are the complete kits - antenna, coax, mount.

Adjusting coax length affects impedance. A typical SWR meter not only looks for voltage, but impedance - correct?

Then what we see at the end of a section of coax is a conjugate imepdance with the coax and the antenna working together. If everything is put together right, the coax isn't part of the equation. It's simply an unbalanced feedline to a balanced load.

e.g. - 25ohms - 5j [a capacitive loading scheme]

As we can look at the smith chart, if I'm not mistaken, I can see SWR ranging from 2.7 to around 1.2 - roughly 180 ohm [using no formula to figure this as an unbalanced feed line of about 6 feet - just notes] to 36 ohms at about 17 feet in length of adjustement range if we use a typical section of RG 58 coax.

Now if I was wrong in the above, please correct me.

Ok, if I'm right, how come the above equation works for developing a working low SWR using a section of coax? If nothing else - does this mean that we are making a transmatch using a coaxial line?

Now, all I'm going to help you with is give you this hint. A lot of base loaded antennas on the market offer a lot of capacitance. With the above conjugate equation, this is about the typical CB'er install that has a poor ground. The antenna is asking for length. Adjusting the coax - means that the antenna is not resoant at it's current location and configuration - we need to do something.

Now, before you slam me as being irrelevant - there are quite a few different set-ups that have poor ground at the antenna radiator location. With this type of conjugate matching scheme of using 18 feet or trimming to low SWR, they can at least operate the antenna - only it is not resonate and the coax becomes part of the antennas radiator system. They simply are willing to sacrifice the performance otherwise possible with a properly installed antenna system, just so they can have an antenna that doesn't destroy their radio.

Otherwise, the concepts of the "Help" radios and their ability to work
in an emergency under less than ideal conditions, would be severely
compromised to the point that they become a civil liability to the
public. I don't see these radios getting banned.

Leland,, your focus was done lost long before I ever entered your world..nice try, but I am not to blame. Of course it is questionable, I admitted that in my post and explained how I arrived at the consensus. Yes, I am certain I calculated all of the actions taken by the FCC in December of '99 if it was ON RECORD..that means available to the public under most circumstances, in this instant. Now if you are not aware of being able to acquire such information, you certainly are not going to get it from me. I want your kind as far away as possible from my playground!
Cell phone laws? Government ramming more laws down our throats? Bub, you are preaching to the choir. That is the most intelligent thing I have read from you yet. Maybe there is hope for you after all, Leland. This coming from an aspiring (?) hammie, no less.
Not only is the VHF thing going to be fun to watch, it's going to be fun to listen to, instead of all that boring QUIET! It will be the same as the rest of all hammie AND cb, he with the biggest toy wins. That's pretty cut and dried, Voobner. Who would disagree with that?
You told me your opinion, I still think they gave us those bands to help. Spin it all you want.
I don't want y'all to disappear along with your posts, just focus on the merits and screw the gut shots and repetitive referrals of, "because it's the law". All laws are not good, Voobner, and minds are like books, they only function when they are open.
And since I refer to one who gets extremely personal talking about sex, peoples mothers, and calling names instead of arguing the merit, a troll, and you cannot fathom why, I can now see why.
I don't give a damn who you align yourself with. As long as you don't resort to the BS IT attempted, we can have rationale discussions.
Now I will give you a hint, Leland. Credibility is ALWAYS an issue when posting.

>> it needs to be measured not only at the radio/coax junction but also
>> at the coax/antenna junction.
>
>Not true. The SWR at both locations is the same.

Only when the source and load have the same impedance, and that
doesn't happen often in mobile installs. Measure SWR at both
connections when the impedance of the antenna is different from the
radio. Then change the length of your coax. The SWR changes at the
radio/coax connection, but not at the coax/antenna connection.

When there is a souce-to-load mismatch you will always have a standing
wave. But when the transmission line is any multiple of a 1/4-wave
(times velocity factor, of course), that standing wave will not be
seen at the source, and the reflected power is radiated through the
transmission line. This is something I have seen for over 20 years,
and it doesn't change just because someone says that it's impossible.

>Keep this in mind. The SWR is, in essence, a measure of the percentage
>of reflected power.

It is a measure of the percentage of reflected power seen at the point
being measured. Different points along the transmission line will
"see" differently, because of the nature of standing waves.

> If the power traveling backward at the antenna
>is not equal to the power traveling back at the radio, where did the
>power go (or come from). Power must be conserved. It is a basic
>law of physics.

As I said before, when you have standing waves, the transmission line
radiates. Find a mismatched system and move a FSM or RF voltmeter
along the length of the transmission line. You will see hot spots
corresponding to the standing wave. After all, an antenna is actually
nothing more than a standing wave generator. Standing waves on the
transmission line are used advantageously by some coaxial dipole
antennas.

I might point out that it is usually better not to radiate your signal
from the transmission line because harmonics are easily generated and
your signal is wasted. An easy way to avoid this is to match the
antenna to the radio and transmission line by adding an L-network at
the base of the antenna. Many mobile antennas already have one
built-in.

>> And it still is not an accurate measure
>> of power transfer, because the antenna may have some reactance that
>> the SWR bridge does not detect because of opposing reactance somewhere
>> else in the system. In that case, an SWR of 1.5:1 may radiate better
>> than a 1:1match.
>>
>> Sparky, FLRC
>
>So you are saying that an antenna that radiates 96% of the power works
>better than an antenna that radiates 100% of the power.

No, I am saying that SWR must be correctly measured in order to mean
anything.

Greetings!

DX clubs exist in all countries, just look at all the www sites
promoting this activity.

With that in mind, the ITU doesn't care about DX - only possible
problems with interference issues.

Since the 'net is available to all, it is perfectly legal to offer
such a NG. It is what you do with the information afterwards is left
for intepetation.

With all due respect, no one was "buffaloed", this individual was approached and a shot was fired across the bow. No action was to be taken on this trip other than inform him that shortly he would be in peril. Would you rather the LEO wait until the law was passed and arrest him? I thought it was handled in a fair manner, your right to think otherwise is fine with me. You do not however, have leave to impugn me with your "herr hambrecht" comments. I have endeavored to avoid any confrontation with those that choose to find FCC regulations do not apply to them, at no time have I used derogatory terms towards any member of this newsgroup. I would thank you to reciprocate. If you choose otherwise you will understand if I refrain from any further communications with you.

the 2510 is not supposed to have talkback in it from the factory but some of them had a low raspy form of talk back that wasn't supposed to be there..... the mods that you are seeing are the ones to clean it up....the problem was that the switching transistors would not completley shut off the receiver and feed back became a problem. reversing these mods will just make it squeel with feedback....

> apology from.....

Remember this little bit of shameful crap you wrote, quoted below, in the "hams taking 11 meters back" thread posted on 12/1/00? I guess you did not even read my post, in reply to you, about your mistaken identification of me as N8, in that thread.

> You lie, Leland. You falsely make accusations of people calling you
> names and cussing you and have no idea who you are replying to...case
> proved by the number of invalid postings by yourself. Man, you must be
> getting it from all angles..thats gotta leave a skid mark right across
> your forehead! Once again, they are laughing AT you.

You remember it now Twisted? I hope so. You stuck your foot in your mouth big time because you thought I was posting as N8. By the way he, N8, must being doing a good job of getting under your skin, judging by your reply I quoted above!

I don't post under false names, or CB type "Handles", because I don't need to hide my identity from anyone, including even you. Just because I am not posting does not mean I am not reading some of the more "interesting threads" on this news group. That's how I know what you wrote, and where.

So like I said if you apologized I can accept it. No harm done. I can be an adult about this.

Nope. Terrible reason for dusting someone. But they were trespassing and 'ol man cotton was tired of them busting down his fences, tearing up his land, etc., etc., put up electric fences, they were cut and destroyed and het posted the shit outta his property, but why are you picking and choosing which laws you like? Didn't you express the opinion that we should obey the law because because because? If you think you OR your property is in danger, you can open fire here. Sorta like the car thief. If I look out the back and see someone in one of the vehicles by the barn, after checking to make sure the kid and 'ol lady are in bed, there are three things I'm gonna do. 1) Spray you with lead 2) Call the coroner and sheriff to remove your dead carcass and 3) shoot my dogs.

Wellllllllll, then Leland, I guess some sort of gratuitous vocabulary would be proper in this certain instant. Consider yourself served! Yea, I remember that one. No excuses here. I did think you were it. After all, look how many multiples he has used and your posts were similar. BUT, since you just HAD to go on about the troll, he wasn't getting under my skin. I responded to his BS, when I realized that is what he wanted, he became the invisible man. Don't be so quick to judge someone by what you perceive to be a certain tone of voice..if you step back and have a good look at what it was directed at, you will see it wasn't shameful at all. On the contrary, it was dead on in content, my aim was bad. So, I guess I sort of owe ya' one. (Did I just say that?) Ok! The next time you goof, I'll let it go without saying a word. Good for one time only. Now we're square.

Forget linears! Why? Because the only time you will be able to talk
further with one is if the guy you are talking with also spent hundreds on his!
If you can't hear them, you can't talk to them. That means that those
spending hundreds on a linear are likely to find only a few extra people to
talk to - "extra" in the sense of not being so near that they could have talked
with them anyway.
Get a GOOD antenna with the SWR as low as possible - and don't settle until
SWR is under 1.5 to 1. You'll get much more results for much less cash - and
you'll even be amazed at improved reception.

So you're saying if my SWR is 1.5:1, I'll get out better by
making my SWR lower.

$10,000 question: Is that extra 4% worth unresonating my antenna?

Hint: Resonance is better then 1:1.

Umm yeah and amateur radio amps on the 10 meter band don't do shit to your phones. OK genius. Have you tried any compromises with your neighbor as to when he can talk? Have you even tried? Or are you just bitching about it because you don't want to talk to the guy about how it messes up your cheap phone. Are you going off half cocked or are you being civil and trying to come to a compromise. You can't have it all your way. Either have your equipment fixed or work out times that are prime time for your TV watching. Your equipment can be setup to not have those problems. The phone is easy, all you need is a properly installed RF Choke and the phone company normally has these on hand. Venting doesn't do any good other than get you all hopping mad about something you can resolve on your own.

"Chas" <eat@joes.com> wrote in message

Why do some of you CB people run illegal power?

All you do is interfere with other peoples lives. How would you like to wake up in the middle of the night hearing voices. It was coming from my phone witch was on the receiver. Echoing whistles and other odd noises on my stereo while watching a rented DVD movie. I bet he is running several hundred watts. Saw the amp setting on his desk the first time I complained. How bad he bleeds varies, I guess to how much power he has on. Turning screws and cutting circuits in the radio dirtying up the signal is bad enough but amplifying it just makes it worse.
I hope the US government makes people get CB licenses again.
Congress has a bill pending to give local police authority to in force FCC rules governing CBs. God I hope it passes. A few bad apples are going to kill it for all of you.

Just had to vent a little. My new neighbor is driving me mad.

Chas

No, the SWR is dependent only on the load impedance and the
characterisic impedance of the coax.

> and that
> doesn't happen often in mobile installs. Measure SWR at both
> connections when the impedance of the antenna is different from the
> radio. Then change the length of your coax. The SWR changes at the
> radio/coax connection, but not at the coax/antenna connection.

No, it doesn't. The SWR is the same at both ends.

> When there is a souce-to-load mismatch you will always have a standing
> wave.

Standing waves are created by a mismatch between the load and the
transmission line only. The source impedance does not affect SWR.

> But when the transmission line is any multiple of a 1/4-wave
> (times velocity factor, of course), that standing wave will not be
> seen at the source,

This is absolutely false. When there is reflected power at the
antenna, it goes back to the radio regardless of the line length.
To suggest that there is some length of coax that will make the
reflected power disappear is nonsense. Where did the reflected
power go?

> and the reflected power is radiated through the
> transmission line. This is something I have seen for over 20 years,
> and it doesn't change just because someone says that it's impossible.

"Reflected power is radiated through the transmission line"???

> >of reflected power.
>
> It is a measure of the percentage of reflected power seen at the point
> being measured. Different points along the transmission line will
> "see" differently, because of the nature of standing waves.

Nonsense. If I measure forward power at the input to a transmission
line, I will get the same forward power measurement at the output
of the transmission line. Similarly, if I measure reflected power
at the output of a transmission line, I will measure the same reflected
power at the input to the transmission line. Power MUST be conserverd.

An SWR meter merely measures forward power and reflected power to
determine the ratio of the two. The power is constant all along
a transmission line. Where could it go (or come from)?

> > If the power traveling backward at the antenna

You are really over the top here. Why would a shielded coax radiate?
How can the RF pass through the shield?

> Find a mismatched system and move a FSM or RF voltmeter
> along the length of the transmission line.

You are confusing common mode currents (currents on the outside
of the transmission line) with the RF within the transmission line.
We are not talking about common mode currents.

> I might point out that it is usually better not to radiate your signal
> from the transmission line because harmonics are easily generated and
> your signal is wasted.

Common mode currents certainly are undesirable. However, they
generate no harmonics.

>
> Sparky, FLRC

SWR meters are not sensitive to any "opposing reactance somewhere
else in the system." Again, this is nonsense. All an SWR meter do
is measure forward power and reflected power. Power is power.

Why don't you tell us why? There is no reason.

> Adjusting coax length affects impedance. A typical SWR meter not only
> looks for voltage, but impedance - correct?

A typical SWR meter measures power (in each direction) and is
designed for a particular impedance.

> Then what we see at the end of a section of coax is a conjugate
> imepdance with the coax and the antenna working together.

We see an impedance. It is not a "conjugate" impedance.

> If
> everything is put together right, the coax isn't part of the equation.

> typical section of RG 58 coax.
>
> Now if I was wrong in the above, please correct me.

You are mistaken. The SWR is constant at all the points.
From a Smith chart, you can calculate the SWR from the magnitude of the
reflection coefficient. The reflection coefficient magnitude is the
distance from the center of the Smith chart to your impedance point.
At you vary the transmission line length, your impedance point
travels in a circle of constant radius around the center point.

That radius equals your reflection coefficient magnitude.
Since it is constant, the SWR is constant. In other words, as you
vary the transmission line length, you are moving around the Smith
chart in a circle of constant SWR.

> Ok, if I'm right... [snip]

You are referring to common mode currents here. I understand that,
when they occur, common mode currents can be difficult to deal with.
But using 18 feet of coax is not a solution; it provides no probability
of helping you better than any other length. So don't bother.

Hello Sterve,

I'm so gratified that you researched all my posts. I'm flattered to think that there are teams of people working on "uncovering" or "exposing" me. But honestly, all you'll find is Aaron Harold Voobner in there, nothing more.

No I'm not Mark Fuller. I read the Usnet archive and ran across Mark's posts and became curious. I agree with many of his points, especially about the detrimental effects of CB amplifiers and the criminal focus of many CBers devoted to freebanding, etc. What surprised me is the depth of reaction to his opinions and the inability of inarticulate cretins to defend their ilegality or do any more than hurl profanities at him.

Which brings us to me, and this newsgroup.

Sterve, I wonder if you can help me out here, something is really puzzling me.

I think people should operate their CB radios legally. That's my philosophy in a nutshell.

Why this concept should provoke such an extremely violent reaction in rec.radio.cb I cannot for the life of me understand.

I notice people are upset that there is too much "legality" in the newsgroup. They want the focus back on "illegality". They get extremely cranky if you mention the top five illegal amp-makers in any context that might prove risky to them. Some people don't want the black-market system to change. Maybe these are the people that are profiting from illegal CB. That's just a guess.

Mark challenged people to act responsibly. What's so UPSETTING to you about that? He said, "if you don't like the CB rules, get them changed". It is possible. That's the way responsible people go about getting things done. But no. Instead you guys would prefer to slink around in alleyways wearing "Born To Lose" tattoos, acting like "bad dudes", romanticizing your incorrigibility.

Lastly, I didn't know Mark was a ham. I don't see any Mark Fuller listed in the ham databases, QRZ, etc. If you have Mark's callsign, please provide it here. I'd like to look him up.

Sincerely,
Aaron H. Voobner

By that time they have failed to do their job and all those years of scuffling with hogs made 'em mellow! Time to get some new pups to break in at that point. Ever see a coon or hog dog being trained? The PETA folks will be all over me, but nothing turns a dog meaner towards a hog or coon than getting it's ass chewed a bit when it's a puppy. Whichever animal does the ass kickin' when the dog is a pup is usually the one that dictates which kind of dog you have. Got a pack now that has two lil stubborn bitches only a year old....a coupla times we had to pull them off the hogs before they ruined 'em. 'Course 'ol Cooter Mae is getting up there in years, now. She don't tangle with the hogs like she used too, she leaves that for her younger descendants, but was a time she was the meanest hog and coon dog in the county, and like a kitten with most people. But let her get a whiff of hog or coon, or an errant bobcat or so, and she goes rabid until the blood is spilled and she gets the heart, and she prefers it warm. She's slow, but at 16 she hasn't lost the scent yet, and she taught me never to doubt her. I've seen the whole damn pack baying and howling after something, only for 'ol Cooter Mae to digress and go her own way and bring the game around. She has never failed me. She can break in a pup in record time as well. I'll shut up now. Get me talkin' hounds and I can go on forever.

I have no doubt you can do simple math. I just wanted to know your source of data.

> Yes, I am certain I calculated all of the actions taken by the FCC in
> December of '99 if it was ON RECORD..that means available to the public
> under most circumstances, in this instant.

I am not convinced that the FCC posts ALL of the actions taken. They have a great many things to watch. Given that, I am sure that only a fraction makes it on to the web. Somebody has to be paid to do it. And as others have posted the FCC is not exactly flush with funds right now. So I think we see just the tip of the old iceberg so to speak.

> Now if you are not aware of
> being able to acquire such information, you certainly are not going to
> get it from me.

Well I can read that two ways. One you don't have a source. Or two, the one you used was not the FCC. Otherwise what is the harm in going on the record with your source? I can get find sources of data, I just want you to go on the record as to where you got your information.

> I want your kind as far away as possible from my
> playground!

Last time I checked the 11m band was for use by the public. It is not your exclusive play ground. You have to share the 11m band with other users. That is a point I think is totally lost on some of the others here. They think they own 11m, and nobody else has any legitimate interest on what happens there.

> Cell phone laws? Government ramming more laws down our throats? Bub,
> you are preaching to the choir.

We are getting this crammed down our throats because many people don't care, or don't believe there is a problem. So the good old USA government solves the problem for us. Well that is what happens when you deny the evidence.

> That is the most intelligent thing I
> have read from you yet. Maybe there is hope for you after all, Leland.
> This coming from an aspiring (?) hammie, no less.

> Not only is the VHF thing going to be fun to watch, it's going to be
> fun to listen to, instead of all that boring QUIET!

That is what is worrying the Hams. The five channels, on MURS, will not be enough. CBers will be out there modifying Ham 2m rigs, because you can get them cheap, and more power too, 50 watts. Given the track record of CBers operating on the "freeband", and showing up on the bottom end of 10m, has more than a few Ham expecting the same thing to happen with MURS. Namely CBers looking for clear frequencies showing up on the top end of 2m. It is just too easy to spin the VFO knob on that modified 2m rig, and I'm sure some will try it.

> It will be the same
> as the rest of all hammie AND cb, he with the biggest toy wins. That's
> pretty cut and dried, Voobner. Who would disagree with that?
> You told me your opinion, I still think they gave us those bands to
> help. Spin it all you want.

A recent issue of QST had a nice write up on the back ground of how the MURS channels came about, and why. There is also some history of why the first "CB" band ended up on 11m when the original intent was to put it up on UHF. You should find that article interesting reading.

> I don't want y'all to disappear along with your posts, just focus on
> the merits and screw the gut shots and repetitive referrals of, "because
> it's the law".

Why beat around the bush? Call a spade a spade. If what I am refering to is the law, well..., it's the law.

> All laws are not good,

I will agree with that. However there are ways to change laws, without having to break them. In fact Alan Dixon, a Ham by the way who writes for Popular Communications I think, when out on behave of the CBers to request the 150 mile DX limit be removed from the rules. He did not have any luck, but at least he tried to change the rules by working within the system. His luck may have been much different if there was not so much out-and-out illegal activity on 11m. The FCC maybe, IMHO, was afraid to make a bad situation worse. The CBers pushing for illegal operations are not doing themselves, or their fellow CBers, any good.

I am sure if the CBers as a group can demonstrate that they can operate legally would make a much better impression with the FCC, and may have resulted in more "privileges" be given. Its just like a parent with a kid. If the kid behaves themselves, and follows the rules, then later the parent "trusts" them, and the kid is rewarded with greater freedoms. In other words one has to prove they can be trusted FIRST. All this illegal activity on 11m does is prove the opposite.

> Voobner, and minds are like books,
> they only function when they are open.

The purpose of a book is to convey facts , and new ideas. One of the problems with a mind is the in ability to acept the "facts" by denying them. I see a lot of this on the news group.

> And since I refer to one who gets extremely personal talking about sex,
> peoples mothers, and calling names instead of arguing the merit, a
> troll, and you cannot fathom why, I can now see why.

Have you had even a gram of success with the above method? He likes to press your buttons, and you reward "him" by a spirited performance! Who do you think I think is the smarter of the two?

> I don't give a damn who you align yourself with.

That's good. So now you don't need to mention it any more, right?

> As long as you don't resort to the BS IT attempted, we can have rationale
> discussions.

It's only BS if one choses to consider it as such.

> Now I will give you a hint, Leland. Credibility is ALWAYS an issue when
> posting.

No. The idea is more important. If I can get somebody to think about something I have posted, the post has served it purpose. Credibility is simply how one perceives something, an idea, or a person. In time even an idea that seems un-creditable can change in to a creditable one with a simple change in one's own attitude.

Where is "here"? I know that lethal force can be used to defend if
there is substantial reason to believe that serious injury or death is
imminent, but I still don't believe that there is a state that allows
a landowner to use lethal force for trespassing. And I am not talking
about one law being more important than another, although it seems
that this state you speak of has forgotten the Constitutional concept
of 'due process'. So what state are you talking about?

What you were seeing was sufficient input from the antenna to trigger the keying relay, as soon as the relay picks up the signal is gone and it unkeys to once again repeat the cycle. Because it has no drive it generates a heck of a lot of RF noise.

Well, hell Sparky! Everyone knows I'm in the land of sand! Our laws are extremely similar to TX. from what I understand, and you can cite all the federal propaganda you want! If you have reasonable 'cause to believe you or your property is in IMMEDIATE danger, or feel your life is threatened in any way, you can shoot. Matter of fact, you can walk around with a pistol on your hip in public, as log as it's not concealed. Yea, we got some good laws and it keeps the crime down..if only them boys in Miami could figure out that everyone is packing, there would be way less that assumed room temperature. Justice is carried out differently in different states..it's the INTERPRETATION of justice by the court that makes it such.

Sure you do. Plus, your "a-1" operation consists of telling somebody
to "go to hell" on the air, just because you disagree with them.

> Take a vote Roger and see who they want out of here.

the internet is not a DEMOCRACY, Dumbass Dan. You right-wingers THRIVE
on denying others their rights of free speech, but are quite vocal
about expressing theirs. Pretty soon, you'll be goosestepping up at the
so-called "liberty net."

> Shall I call you Al?

Al? Oh, you mean the guy who tried to LEGITIMATELY get voted into
office. Hell, FUCKHEAD, I could care less what you call me. Now, get
back to felching your dead mommy.

Cross-posted to: alt.radio.scanner.flame_fest,rec.radio.amateur.policy,rec.radio.cb,rec.radio.amateur.misc,rec.radio.shortwave

Mark,

If you'd bothered to check QRZ before making the statement that I'm too lazy to learn the code, you'd have noted that the date on my license is February 26, 1997, and that it's an Extra class license. The code testing requirement at that time was still 20 WPM, and I still think that code testing at any speed above 5 WPM is a worthless hazing ritual.

Yes, the use of morse code in the movie, in that given situation, was appropriate. However, a movie is not reality. In reality, the odds of such a situation happening are about the same as the odds of the San Diego Chargers making it to the Super Bowl this year.

Anyone who finds old Road Runner cartoons entertaining, especially the ones where Wile E. Coyote is always falling off of a cliff, will enjoy Vertical Limit.

Well, now we know that you really don't want to debate the issue.
All you want is to stir up the shit. There were quite a few well said
answers posted here and all you say is " If an illegal really cared he
wouldn't be illegal." That just proves that you don't give a damm about
whether any law is broken or not, all you want to do is piss everyone
off. If you wanted to debate the issue you would, but you don't.

Hi Jerry,
Though I may not agree with you, a point is brought up..... "Taking responsibility for his actions."
One must take responsibility for his action, no matter what the situation is. My point is if I break the laws on CB, it really isn't any worse than a vehicle code law being broken. You can drive drunk hit a van head on and kill 15 people, you must be ready to take responsibility. The same goes for operating out of band or with a linear, you must be ready to take responsibility. I speed, I am responsible, I pay the fine and decide if I will do it again. I just don't understand people like Dale or Aaron out here, like it is some form of Holy Crusade. At least when talking with you there can be discussion about it.

Hello Chas,
Sorry to see you leave with that attitude. But I will say it was never
this way Before. All these people came out of the woodwork and started
screaming ‘Witch CB‘r‘ and now when someone does complain they take it
that way.
One other thing you might try is putting .008 caps between the
positive & negative of the speaker and see it that reduces the problem
a little.
Good Luck,

Aaron believe me no one here is that desperate. I am part owner of an ISP. Within seconds I can perform a TraceRT which would tell me you real IS provider and your individual logon hex code, which you are not worth the time. It was you, in a previous posting that directed the group to QRZ.COM. It was also you, who, in a previous posting, stated that personal threats would not be tolerated. Yet you are demonstrating, with some sort of immature coat-tailing, a non viable attempt to intimidate people via newsgroup threads. You are in fact facilitating the same threats that you've previously posted that you are against, only they are in a disguised form. No-one here really cares or is intimidated by your tactics. All you are doing is eating up NG bandwidth.

BTW stop timeing out the repeater.

It all gets back to the rules regulating Part 15 devices. If the licensed station is operating within legal guidelines, then the Part 15 device must tolerate, or perhaps more accurately, the owner of the Part 15 device must tolerate the nuisance. There was a research study some years ago which evaluated interference complaints, and a good many of them came from 4 watt CB stations who were operating cleanly and within legal guidelines. That didn't mean that something was wrong with the station--quite to the contrary. The Part 15 device was defective. Try to convince your neighbor of this though.

I was wrong. QRZ turns up THREE Mark Fullers as hams.

Wait till they find out that you geniuses are posting erroneous information about them. How would you feel if someone was using your name in a public forum in a derogatory manner? I know I'd be rather concerned.

aaron, you did more than mention the name of amp makers you involved and named innocent people in your quest to be a asshole. perhaps your name could be posted on another NG citing you are a pedophile or better yet involved in some other illegal activitie that would warrant some type of investigation in your life warranted or not. See how you like it. Where did you say you were from aaron ? texas?

The part that you don't seem to realize is, most CBers can see by these silly ass statements that getting a ticket will only result in subjecting themselves to more of the same. I am more than capable of passing the exams, I've proved that to myself. The time and work I've put into my equipment proves I'm not Lazy. It is by choice I will not seek an endorsement by the FCC nor the ARRL that will open the door to more complainers. I'm not making this up, just look at this group. I think this group has become a fair representation of what it is like using the amateur bands wouldn't you?

.....ain't taking a damn thing back!

Diagram a cat whicker?

> And in 1919 the test speed was doubled to 10 wpm.

Ohmygawd! When morse was highly relevant it was doubled all the way to
10wpm which is where most people get stuck at when trying to get to
13wpm. Perhaps there was a valid reason for selecting 10wpm.

> > If it was good enough back then when morse was a valid

Only because hams were forced to learn it. Amateur radio has become an
anachronism.

Fair enough. Would you have whined about it if you could have?

> And it happened voluntarily. Tube transmitters gave results that were
> so much better than spark rigs of the same cost, and used up so much
> less spectrum, that it was a done deal by 1924.

We need more done deals like that. It's much less traumatic than the
gradual "weaning" from code that is currently stressing the service.

Lets see, Gore and the demodummies demanded a recount and Bush won the recount, so they wanted another and Bush won that one too. So they demanded a hand recount of only counties that would favor Gore and still Bush was winning so they wanted recount again and change the rules to count dimple chads (no votes) to count for Gore and throw out the overseas ballots that would favor Bush. In other words, Gore wanted keep recounting and changing the rules in hopes that he could somehow come up with the votes he needed to steal the election Yep that was a "legitimate" try to get voted into office.

If you had not included your ham call I would swear by the language you use you were just a cber.

By the numbers:

1. Get for them, or have them get for themselves, the
Interference Handbook from the FCC Call Center (1-888-CALL-FCC)
which has a good explanation of overload and audio
rectification from the consumers' standpoint.

2. Tell them that you will be available to make a reasonable
number of on-the-air tests to help them see if whatever they
try is effective.

3. "Pull the plug" on contacts with them about this until they
ask for an on-the-air test.

4. Do not, under any circumstances, modify or add anything to
their Home Electronics/Entertainment Equipment, but cooperate
with their service tech (by explaining and educating, not doing
repair work) if s/he requests.

5. Do not go "off the air" unless you are NOT in compliance with
the FCC Regs for the service in which you are operating (Amateur,
CB, MURS. GMRS, etc).

That attitude is no doubt why the legislation was passed allowing local
authorities to enforce FCC regulations regarding unlicensed transmitters...

It is not the act of helping, but rather the manner in which you address
your neighbor's complaints that will determine if you give up your
protections or not. However, just blowing them off will surely motivate them
to escalate the matter to other authorities.

One of the talk show hosts said it pretty well today. The football game
was in the fourth overtime with Bush leading by one point. Gore had the
ball on the ten yard line. All he had to do was kick a field goal. He
instead chose to run the clock out with two illegal procedure plays.

Save the BS Mark. The pre 12/99 Deja archives were down until just last week because Deja-news was updating their server and it just so happens I too was trying to research a posting from a different newsgroup just two weeks ago, which I couldnt because the files were unavailable. You can verify this by emailing them directly.

>That attitude is no doubt why the legislation was passed allowing local
>authorities to enforce FCC regulations regarding unlicensed transmitters...

The legislation was passed because the local authorities in
Beloit, Wisconsin did not like the FCC telling the consumer the
truth: that it was their cheap Home Electronic/Entertainment
Equipment that needed to be upgraded and protected fromoverload
and audio rectification.

They jumped to the conclusion that all would be right in God's
Heaven if they, the locals, could be the radio cops and REALLY
show them (the FCC). They had enough juice to convince Senator
Feingold (D-Wisc) to start the ball rolling on such usurpation
of FCC jurisdiction, and the powers that be inside and outside
of the FCC who could have stopped such hijacking on exclusive
Federal jurisdiction grounds stood around and did nothing.

The authority granted to local governments to pass and enforce
statutes and ordinances about CB radio by the Feingold Bill
says not one word about interference investigation or
resolution. All they are authorized to do (wrongly, in my
professional opinion) is to enforce FCC regulations dealing
with use of non-type-accepted equipment and overpower and
out-of-band operation (as if they know what they are doing, but
that's another matter).

The first local government who passes a statute or ordinance
which confers upon themselves any authority to investigate and
resolve interference complaints in any manner other than as
permitted above or by referring the complainant to the FCC is
setting themselves up for being on the receiving end of a
restraining order in Federal District Court, because the
Federal Courts of Appeal have held for many years that the FCC
has exclusive jurisdiction in matters of interference
resolution.

I'm just itching for that one....

>It is not the act of helping, but rather the manner in which you address
>your neighbor's complaints that will determine if you give up your
>protections or not.

The protection exists - and is enforceable - no matter what
your neighbor thinks about it.....

>However, just blowing them off will surely motivate them
>to escalate the matter to other authorities.

Let the good times roll, baybee....

The only "other authority" that has any jurisdiction is the
FCC and it will give them the same line as detailed above.

Exactly!

The whole key is that I can still respect and disagree at the same time. If someone attempts to present facts (tho it may be only from one's own impressions of law), or opinions, and does it in a mature, reasoned manner, then we have a discourse of gentlemen instead of the immature baiting and flaming we have been reading. I will admit that a *little* of the spicy posts liven things up for a short time, but it gets old really fast! LOL!

Best 73 to ya!

The legislation was passed because people are tired of interference caused by the illegal operations of cb operators running illegal power, illegal radios driving crappy designed amps splattering all over the radio spectrum. The cb community brought this legislation upon themselves by refusing to operate legally.

check with your lawyer first before you do anything! you are under NO OBLIGATION to do anything! FCC rule part 15 is clear look at part 15 the label on the device ..... MUST accept interference..... it's not your problem it is the owners!
you make it yours YOU WILL PAY $$$$ we know that people want to do the right thing and help; no one wants to be a thorn in someone's side but in this nation doing the right thing went out the door 25 years ago[good example; car accident ...you render assistance....person is "allegedly" hurt by your actions ..... you get sued because you are not trained .... your found negligent .... now your ruined! happens every day to good folks like you doing the right thing] your "loving" neighbors will gig you if you make the wrong move ....(just like the accident victim or the victims family) a word to the wise! stay with the law (FCC part 15) or PAY big $$$$$$$$BUCKS defending yourself!

You see that is the way a good little
storm trooper is, blind and can not see.
All he's concerned about is illegal,illegal
that's it. Now I wonder if he speeds, gives
back the extra change giving by accident,
dropped a piece of litter, driven his car
after one to many drinks, gotten oral sex
from a woman (illegal in some states) the list
is endless for our little storm trooper.
No he's not willing to see it like a judge
would, that's clear. At least a judge is going to
see this with an open mind, not a closed trap.

The Landshark

You may be right about people being "tired" of "interference",
but please see my extensive posts in rec.radio.amateur.policy
for the history and analysis of the Feingold Bill which is a
pure pizzin' contest between local jurisdiction and Federal
jurisdiction.

I stand on my statements about the causative factors of that
Bill, which I have been tracking and opposing on jurisdictional
grounds for several years. What professional background do you
bring to substantiate your claims?

aaron you are wrong agin, xforce is a copy of davemade so #12 dennis did not design the amp for them, and you stated that a guy named Concrete Man not dave in Nj was the guy that runs davemade and that they are part of some cocaine ring. are you fucking nutz or what ? Dont answer that but you are dead wrong again on all counts. Thats the problem you are researching deja news trying to piece togther newsgroup posts to come out here and start shit. But the best thing is half or more of the shit posted in hear is bullshit and alot of bragging,cb myths and lies so your internet detective kit has failed you. You are searching the post in hopes of finding ammo to use against people who post hear. You must be un-employed and have no wife or girl friend since anyone who wastes as much of thier time as you do is in need of some serious medical help

i think you are right cold, there is just something about this cb radio stuff. even the hams that used to be cber's just can't seem to shake the feeling. imagine that. by their own admissions, these guys can go wherever they want and talk legally but somehow they have time to come on 11 meters and key up their stock qrp mudduck radios. this is something i cannot fathom. why on earth would these guys come on 11 meters, i mean the heterodyne, the skip , etc ,is so bad, hell you cannot even talk local until it simmers down everynight. but boy i tell you, these guys look for anything and everything they can to try and get somebody in trouble on the 11 meter band. i ask you . who the hell invited these mudducks to come on here and talk all this noise about legalities, comode, comode,.......cd is out.....

Dear Big Poppa,

Honest to God, I'm trying to pack for my trip and you people are keeping me here in this newsgroup with your nonsensical replies.

Look. I heard DaveMade is run by a guy in New Jersey. I also heard he deals cocaine. So now what? Is this as of yet unidentified guy in New Jersey going to sue me, Aaron Voobner, for defamation of character? I can just see it now:

DAVE: Your honor, Aaron Voobner said my illegal CB amplifier company is supported by the sale of cocaine.

JUDGE: What is your complaint, sir?

DAVE: Thanks Judge, you can call me Dave, or my handle, Concrete Man. The things is, your honor, I don't want my illegal CB amplifier company associated with drugs...

You guys need to get your act together. Hit the books. Figure out what rights a manufacturer of FCC-certified-illegal devices has or doesn't have. - Aaron

Hey Big Voob, I asked -only- WHERE and -not- HOW. You OK little man? Never thought I'd see the day when The Voob got rattled by a simple polite question.

Anyways, the reason I was asking was that I go straight to the power search page and they haven't had anything before 15 May 1999 available for a long time. Weird how the simple search has all the archives but the power search doesn't.....

Poor kid's coming apart like a stuffed animal donated to the orphanage. Y'all should take it easy on the little guy when he's ready to come back. No wonder he's gotta "go out of town".....

Coax Length i personally agree with you on all your points you have stated with fact and formula the others with hot air. Personaly i use multiples of 6'/ 1/4 w I know it doesnt change the actual swr but it changes what i see at the meter i check the swr at the 1/2 wave point so it repeats 0 deg / 180 deg If i am not mistaken.

The thread started with mobile antennas. SWR is the absolute poorest way to adjust a mobile. The best way is with a simple field strength meter made with a cheap meter movement a germanium diode and a pot. Adjust for max out and the heck with SWR. As you so aptly pointed out the losses are miniscule do to SWR. An SWR of 10 to 1 will cause an additional loss of less than 5%, now your radio may have shut down because of the high SWR but the losses are not meaningful. Anyone worrying about reducing a 1.5:1 down to 1.2:1 must also enjoy picking fly deification out of the pepper. I use nonresonant antennas on my ham stuff (130 Foot 12" diameter cage fed with ladderline and at the output of the tuner my very best SWR is about 8:1 and is as high as 16 to 1 on some frequencies.

Of course I use a tuner so my radio is looking at 50 ohms. The swr is unaffected and still exists with little effect on my signal.

>

```
: >So you're saying if my SWR is 1.5:1, I'll >get out better by
: >making my SWR lower.
:
: The gains will probably be small after you're down to 1.5:1 - but from
: my
: own experience, I can tell you that the performance increase from getting
: down
: from 2.5:1 to 1.2:1 is ENORMOUS.

It depends. What you say is true if you have a long run of lossy coax.

But if you ran ladder-line, the SWR is essentially immaterial. It is not
unusual to run 10:1 or worse on some antenna systems, and essentially ALL
of the power is radiated. This is because ladder line is very close to
being lossless - and is considered to be lossless for all practical
purposes.

Subject: hot stock
To: grrxdxrxc@hotmail.com
Date: Wed, 13 Dec 2000 20:22:27 -0600

From: John Gillespie
Subject: The deal that I promised you=2E

Dear Friend,

We don't like to brag, but did you miss out on our last four plays?

NTAP NETWORK APPLIANCE INC
Bought at 11=2E Sold at 79=2E A 626% return=2E

MERQ MERCURY INTERACTIVE CORP
Bought at 17=2E51=2E Sold at 90=2E A 412% return=2E

BOBJ BUSINESS OBJECTS
Bought at 17=2E3125=2E Sold at 89=2E A 415% return=2E

ANEN ANAREN MICROWAVE INC
Bought at 13=2E082=2E Sold at 106=2E A 710=2E27% return=2E

These plays were great but as you know, I love buying $10 and $15
stock and riding them into the $100 range but the above returns are
nothing compared to the opportunity that is coming up in the next few
days=2E

The great thing about this stock is that it is currently unknown and
selling for, get this:

=2E55 cents a share=2E

I believe this stock is going to hit the $5 range before the end of
the year=2E

Just keep reading=2E

The company Q Seven Systems (Ticker Symbol: QSSY) creates cutting
edge software for casino and gambling sites=2E The fastest growing
sector of the internet=2E But more importantly, a sector that has been

totally untouched by the drop in the NASDAQ earlier in the year=2E The great thing is that this market is moving so fast that it is sneaking under the radar of almost all Wall Street Analysts=2E It sounds crazy but most companies that support casino sites were actually up after the crash=2E Inside investors know that casino sites are here to stay without the problems of non profitable =2Ecom companies=2E

The price right now is at $=2E55 a share

The strategy:

Buy: as many shares as you can handle at any price below $1=2E50

Your fellow investor,

John Gillespy
President/ CEO
Private Online Stock Trader Club=2E

: do nothing! if you do YOU are admitting in court YOU are at fault you have
: LOST your protection in court! you open your self up to various types
: lawsuits the best thing is do nothing!

This is not true. All it means is that you are willing to help the neighbor fix the inadequate design of the consumer equipment that is receiving the interference. If your station is legal, and you end up in court, it had better be Federal Court and be the result of a federal summons.

In other words, local courts have no jurisdiction over legal stations.

Of course, you can be sued over just about everything. Whether the person filing the suit will have a chance depends on the suit. For interference problems from a legal station - the court would throw the case out.

Sparky <sparky@cet.com> wrote:
:>
:>Not true. The SWR at both locations is the same.

: Only when the source and load have the same impedance, and that
: doesn't happen often in mobile installs. Measure SWR at both
: connections when the impedance of the antenna is different from the
: radio. Then change the length of your coax. The SWR changes at the
: radio/coax connection, but not at the coax/antenna connection.

Not true. The SWR is identical everywhere on the coax. That does not mean that your SWR meter won't show different readings at different locations. But if it does, it is wrong. That is a problem with the meter.

There are a couple of reasons why changing the coax length gives you an APPARENT change in SWR. RF currents on the outside of the coax is one. The phases of the forward and reverse voltages/currents inside the coax is another.

: When there is a souce-to-load mismatch you will always have a standing
: wave. But when the transmission line is any multiple of a 1/4-wave
: (times velocity factor, of course), that standing wave will not be
: seen at the source, and the reflected power is radiated through the
: transmission line. This is something I have seen for over 20 years,
: and it doesn't change just because someone says that it's impossible.

Again wrong. There will not be a standing wave unless there is a mismatch between the transmission line and antenna. (or between two sections of coax of different impedances). It does not matter what kind of mismatch there is between the source and the load. All that effects is the percent of the generated power that is transferred into the coax.

If there is a SWR, the reflected power will reach the source/coax junction. What happens when it gets there depends on a number of variables.

:>Keep this in mind. The SWR is, in essence, a measure of the percentage
:>of reflected power.

: It is a measure of the percentage of reflected power seen at the point
: being measured. Different points along the transmission line will
: "see" differently, because of the nature of standing waves.

Wrong. Apparent SWR is what is seen at the measuring point. True SWR can often only be measured at the antenna.

:> If the power traveling backward at the antenna
:>is not equal to the power traveling back at the radio, where did the
:>power go (or come from). Power must be conserved. It is a basic
:>law of physics.

: As I said before, when you have standing waves, the transmission line
: radiates. Find a mismatched system and move a FSM or RF voltmeter
: along the length of the transmission line. You will see hot spots
: corresponding to the standing wave. After all, an antenna is actually
: nothing more than a standing wave generator. Standing waves on the
: transmission line are used advantageously by some coaxial dipole
: antennas.

Again, you are generalizing. There is no need for the transmission line to radiate - regardless of whether there is a mismatch or not. If all the power is confined to the inside of the coax, as it should be, then it will not radiate. If there is coupling to the outside of the coax, then the coax will radiate - with or without standing waves.

For example, with ladder lines, there may be a 10:1 or higher SWR. But the radiated power is almost immeasurable. There is a slight amount of radiation, as the two wires are separated, so the fields do not perfectly cancel.

: I might point out that it is usually better not to radiate your signal
: from the transmission line because harmonics are easily generated and
: your signal is wasted. An easy way to avoid this is to match the
: antenna to the radio and transmission line by adding an L-network at
: the base of the antenna. Many mobile antennas already have one
: built-in.

Harmonics are not generated, if they are not there in the first place. But if the coax is a resonant length for a harmonic, it will radiate that harmonic efficiently.

Matching networks are no guarantee that any currents on the outside of the coax will be reduced, much less eliminated.

:>So you are saying that an antenna that radiates 96% of the power works
:>better than an antenna that radiates 100% of the power.

: No, I am saying that SWR must be correctly measured in order to mean
: anything.

What you should say that SWR, of itself, is not very important. I can have an antenna with a 2:1 mismatch that radiates better than if I tune the antenna for a 1:1 match. Why? In the first case, the antenna is resonant, so radiates all power fed into it. All that is necessary is that the transmission line losses are negligible - pretty much true for low values of SWR. In the second case, the radiation efficiency of the antenna is much lower, as it is not resonant. That means much of the power is lost through heating - rather than radiated as a signal.

Message-id: <916m17rlj1@iac5.navix.net>

I had a chance to ride with one of the local police today on a visit to a CBers house. He had been asked a number of times to cease and desist with his overpowered illegal operations.

This person has been the bane of existence to all his neighbors around here, he was handed a copy of the latest federal law, along with the purposed local laws. It was made clear that he would be the target of the first test case under the new law. I observed him trying to justify his rights to do what he wanted on the CB band. He stated that he had heard the FCC no longer controlled CB along with a litany of other excuses. The local law officer explained in a respectful manner that he would shortly have jurisdiction and he should consider this as his final warning. "Hey! you mean your serious?" was his response, the officer responded "as serious as a heart attack" at that point he walked back in the house and brought out what he refereed to as a "ModgeBox" and handed it over to the officer. I believe that this law is going to work. Any way Ga231 sends all the good numbers... He's going 10-7

Handy Andy <CodysPC@iserve.net> wrote:

: Ok, I see your point, and here we go again. As far as Radio Shack,
: take a trip to their store and ask for the manual to their Deluxe
: Magnetic Mount CB antenna - or any CB antenna that has a pamphlet with
: the wrap. They are WARNING you not to trim the coax. I'd like to know
: why, aside from ruining their pretty job of soldering the PL259 end
: on. ;-) These are the complete kits - antenna, coax, mount.

: Adjusting coax length affects impedance. A typical SWR meter not only
: looks for voltage, but impedance - correct?

Wrong. Adjust coax length affects the input impedance of the coax. It
does not affect the impedance of the coax, or the match between the coax
and the antenna.

: Then what we see at the end of a section of coax is a conjugate
: imepdance with the coax and the antenna working together. If
: everything is put together right, the coax isn't part of the equation.
: It's simply an unbalanced feedline to a balanced load.

Nope.

: e.g. - 25ohms - 5j [a capacitive loading scheme]

: As we can look at the smith chart, if I'm not mistaken, I can see SWR
: ranging from 2.7 to around 1.2 - roughly 180 ohm [using no formula to
: figure this as an unbalanced feed line of about 6 feet - just notes]
: to 36 ohms at about 17 feet in length of adjustement range if we use a
: typical section of RG 58 coax.

If you use the Smith Chart correctly, you will see a constant SWR of
approximately 2:1 - anywhere along the feedline length.

: Ok, if I'm right, how come the above equation works for developing a
: working low SWR using a section of coax? If nothing else - does this
: mean that we are making a transmatch using a coaxial line?

No.

: Now, all I'm going to help you with is give you this hint. A lot of
: base loaded antennas on the market offer a lot of capacitance. With
: the above conjugate equation, this is about the typical CB'er install
: that has a poor ground. The antenna is asking for length. Adjusting
: the coax - means that the antenna is not resoant at it's current
: location and configuration - we need to do something.

Adjusting the coax will not change the resonant frequency of the
antenna. That can only be changed by adjustments to the antenna.

Phil, you need to get off the power trip about your qualifications. First of all, they are not all that impressive. Second, since most people in these newsgroups seem to judge opinions on their own merit, not by the real or imagined qualifications of the person posting, I suspect that JR, or anyone else who post opinions in this newsgroup, has just as much credibility behind those opinions as you do.

That is especially true when you're flat wrong, which you are. As we've discussed before, the situation today in the Citizens Band is the direct result of many years of failed FCC enforcement.

Yes, like you so often point out, because of budget restraints, the FCC today does not have the money, resources, or personnel, to properly enforce the Citizens Band. But that excuse (yes, excuse) was not true in the 70's when this problem first started. Nor was it true in the early 80's when illegal operations in the citizens band was rare, and therefore more easily controllable.

But, the FCC sat on its butt all those years until the problem got completely out of control, and now you, and many at the FCC, want massive amounts of money to be given to the FCC so that it can attempt to get the problem under control.

Now, I realise that, since you once were employed at the FCC, you don't want to accept this description of the situation, but the facts

speak for themselves.

Which brings us to today, and this legislation. It is the feeling of many people, myself included, that it would be foolish to give more money to the FCC so they can attempt to do a job that they have already demonstrated they cannot do. Nor is there any mood in this country to see another greatly expanded enforcement agency in Washington.

Oh, I'm sure that you're still insisting that the 20, or so, enforcement agents at the FCC can handle the estimated 25 million CB'ers, so there is no need for extra personnel, but I think most people are smart enough to see right through that nonsense. To enforce the citizens band properly, the FCC would have to hire hundreds of new enforcement agents, which is simply not desirable in the current trend of government downsizing.

So, in the end, that leaves this legislation as the only possible solution to the problem. And no, it is not the perfect solution, but it is at least something that has a chance to resolve some of the local problems caused by illegal operators in the citizens band. Or, to put it another way, it obviously has more of a chance to work then the current FCC enforcement efforts.

But it can cost you dearly in lawyer's fees to prove that the court has no jurisdiction. Didn't that happen recently in Ark or Ala (Help me out here someone)? The ham was taken to a local court for interfering with his neighbor's electronics. As I recall the ham was finally exonerated, but not until after lots of grief for him...

>Of course, you can be sued over just about everything. Whether the person
>filing the suit will have a chance depends on the suit.

Especially if you make the neighbor hate you enough. Sometimes even worse things than lawsuits can happen if you make someone hate you enough... (Even in NGs, right Steve...)

>For interference problems from a legal station - the court would
>throw the case out.

Maybe not. Lots of bad court decisions have to be appealed. Lawyers love it. Bottom line: *if possible* complete cooperation with your neighbor is usually best...

Aren't you getting a little excited too soon? This guy wasn't busted.
He wasn't fined, jailed, or even arrested. So where is the "busted"
part? A warning is not being "busted". He might have been "caught" so
to speak but there wasn't anything the officer could do to him at that
point so the guy got off scott free. The guy with the radio could have
easily shut the door on the officer and gone back to what he was doing
if he wanted to. Granted if he had then yeah, he would be busted
eventually but so far he wasn't, so try again bucko.

Aaron,
There were two cases in Mississippi, don't know about
Arkansas, and at least two cases that I know of in Oklahoma.
One of the cases in Oklahoma did cost the ham a few bucks,
but there were extenuating cercumstances. The other case
that I'm aware of in Oklahoma, cost the ham involved about
$3.00 to make the response to charges 'look' good by putting
it in a folder. Also cost maybe 45 minutes, including waiting
till the case was heard. You don't need a lawyer.
(Been there, done that, cost me $3.00)
'Doc

What are your qualifications, Dwight? I mean, *besides* announcing the
passage of HR2346 with a big grin and wielding it like a club in every group
that could possibly be of interest to CBers... Like this little gem from
Dwight in RRC:

Message-ID: <3A27619E.22EAE3F6@sccoast.net>

I was just wondering something about HR-2346? Since this allows
local legislators to write laws based on FCC regulations, will that include
the forfeiture amounts spelled out in the FCC regulations? In other words,
are we talking about local courts handing out fines up to $20,000 for each
rule violation? If so, that will certainly encourage local law enforcement
officers to go after CB'ers with a vengeance (there are very few $20,000
speeding tickets).

I can see the glee on your face as you wrote that...

> people in these newsgroups seem to judge opinions on their own merit,

Or total lack thereof...

> not by the real or imagined qualifications of the person posting, I

I bet you wouldn't say that to Riley.... Or Mr. Feingold....

> suspect that JR, or anyone else who post opinions in this newsgroup, has
> just as much credibility behind those opinions as you do.

Dwight, you and JR are possessors of neither credibility nor qualification to speak to the causative factors of HR2346. You're a gang of two CB haters angry that anyone could oppose the legislation of your dreams on something as meaningless to you as "jurisdictional grounds", which for those who care about proper implementation of legislation is a VERY meaningful thing, your evident hatred of CB and CBers notwithstanding, and my opposition to HR2346 (although I am a legal CBer) also notwithstanding.

<SNIP "cause everybody hates CBers just like us" Rant>

Other than the fact that JR is a longtime asinine troll in rec.radio.cb... An endless source of such monosyllabic one-liners as "typical cb'er" and "what did you expect
from a cb'er", and Technician Dwight being a more literate anti-CBer hammering out his vengeance on the CBers in misc.transport.road, misc.transport.trucking, and of course rec.radio.cb, sure, they've both got HARD opinion credibility on the causative factors of the Feingold Bill. In their pants, that is.

Hello Wild Bill: I am all for going toe to toe and nose to nose, but
the guys on the ham newsgroups don't like the flamers either.

Just look at rec.radio.amateur.misc a few days maybe a week back, one of
the bozo's said "come on over to rec.radio.cb and help out. The lions
majority said he was a ass hole, and who cares.

You handle these Mommas boys, bet wetting, butterfly chasing, tree
hugging people like anyone else whos wants attention, you just don't
give to them.

Beside most all the hams where CB'ers at one time or another, any way.
So cross posting to the ham ng's won't make any money IMHO.

Jay in the Great Mojave Desert.

I'll do better. Starting at page 513 of Robert Kellejian's "Applied
Electronic Communication", ISBN 0-574-21535-2, summarized. My own
comments are in parentheses.

When the impedances of a source and a load are mismatched, part or all
of the incident power is reflected. (This is NOT a standing wave.) The
reflected power is sent back to the source and dissipated in the
source impedance.

Add a transmission line. When the source impedance is equal to the
line impedance, and assuming a lossless line, it acts as if the load
is directly connected to the source, and reflected power from a load
mismatch originates from the line/load connection.

Alright, now you have incident and reflected power travelling along
the same transmission line. The phase velocities are the same, but the
phase relationships are different, and their phasing interaction is
what causes standing waves. They are called 'standing' waves because
they don't move, and can actually be measured along the transmission
line.

A standing wave along a transmission line behaves just like an
antenna, in that it has points of high voltage and points of high

current which are 1/4w apart from each other. The point that has high voltage is also a point of high impedance, and the point of high current is a point of low impedance. When this happens, the transmission line does not behave as predicted because the line is designed for a fixed impedance. Power is therefore lost in the transmission line and is radiated away as both heat and RF.

Back to the phase relationships. When the coax length changes, so does the phase relationship, and therefore the location of the standing wave (assuming the mismatch, and the incident and reflected power are the same). If the standing wave detector is fixed to the source, and the length of the coax is varied for 1/4 wave, it will detect a change in the standing wave equivalent to the full amplitude variation of the standing wave, including a zero point where it will not be detected. (Bear in mind that the reflected power does not change, but the standing wave is simply moved to a point along the transmission line where it cannot be detected.)

Now back to the transmission line. Granted no line is perfect. But a perfect coaxial transmission line will contain all the RF within the shield. This is assuming that the impedance of the power transmitted through the line is equal to that of the line. When it is not equal, as in the case of a standing wave, containment fails and the shield radiates RF. If the transmission line is a multiple of 1/4w and positioned in a straight line, no harmonics are radiated. But as we all know, that is almost never the case. (In the case of mobile installs, however, the harmonics are generally contained within the vehicle).

If this doesn't satisfy you, I guess you'll have to actually read a book, and then learn how to use a meter.

Life, but not property. I checked several states, and none of them allows the use of 'deadly' or 'lethal force' to be used in defence of property, only in defence of life or defence from serious bodily harm. Those must have been really nasty mushrooms for that farmer to think his life was in danger and shoot those kids. Are you sure he wasn't grazing in the field himself?

Hello JR: Stick to perching about all us criminals, with that Barny Fife "arrest grandma for jay walking" attitude. Remember Andy wants to you to keep your bullet in your shirt pocket.

My antenna tuner matches the impedance of the coax to the antenna, thus transferring max power. Thats why it works so well.

Ladder line! yeah right when it starts to win shoot outs.

Jay in the Mojave

Greetings!

Whap! Whap!

Hello, you guys are stuck with the "antenna" part. Never getting past the damn tree to see the forest.

"Antenna System" because the antenna, now includes the coax. It's now the antenna! Yes, thats right. A simple unbalanced feedline now acts like a radiator. Ponderous thought isn't it?

[WOW!] You guys should check your glasses. You're not reading the textbooks expiration dates correct.

Boy, you gotta' luv these guys...

I'm not going connect all the dots for you. Many people believe what they want. I've taken the time to at least make an effort.

Quite wasting my time on this. If you guys can't figure out the difference between which end of the coax you should be using, then maybe you shouldn't post such contradictory stuff.

Hey, the problem with the whole coax length issue is dealing with the antenna location. It's simply not resonate there, but just a few feet away, that very same antenna - *WHAM* BINGO - a 1:1 SWR - WHAZZAP?

Boy are you guys a lot of help - the answer to the problem in most of the cases is due to location.

But, no...no one wants to cooperate and share the idea and focus on the end result.

I have yet to hear anything of a logical answer to the kids question, from you or George. If coax length doesn't matter - you guys are really naive.

I tried and it's pretty close to the answer you'd get "out there". And since I don't see any of your posts answering, nor GeorgesMAC - I think you guy like to troll. You never answer this type of question ever, and all you guys think up on this, is the SAME crap and BS I see everytime.

Bother me later. When you have an understanding of what I'm talking about.

You guys need a life.

> from Dwight in RRC:

My qualifications are none of your business, RadioFree. I'm not about to get into a "my qualifications are bigger than your qualifications" debate. Besides, like I said in the previous message, qualifications are not an issue in these newsgroups unless you choose make them so (which Phil did).

As for my messages about HR-2346, if I remember correctly, I've only posted three messages about this subject since the passage of HR-2346 (and one of those related to marine radio regulations, not anything about HR-2346 itself). So your suggestion that I've been posting comments about HR-2346 "in every group that could possibly be of interest to CB'ers" is a boldfaced lie.

In fact, the only reason I posted a response in this thread was because it is cross-posted to a couple of ham radio newsgroups (which is where I saw it). I very rarely even look at the CB radio newsgroup, simply because I'm not really that interested in CB radio today.

> Dwight, you and JR are possessors of neither
> credibility nor qualification to speak to the
> causative factors of HR2346.

RadioFree, I don't really care what you think about either my credibility, or my qualifications. First of all, after your obvious lie above (and below), I certainly have far more credibility than you do. And you don't know a thing about my qualifications, so you have no mandate to judge them.

> You're a gang of two CB haters angry that anyone
> could oppose the legislation of your dreams on
> something as meaningless to you as "jurisdictional
> grounds", which for those who care about proper
> implementation of legislation is a VERY meaningful
> thing, [snip]

When I see meaningful "jurisdictional grounds," then I'll be glad to discuss them. However, so far, all that I've seen is a bunch of nonsense. If there were the "jurisdictional grounds" you claim, then certainly the lawyers at the FCC, the Congress, or the White House, would have already addressed them long ago. In other words, they simply don't exist (other than in your mind).

And it is a little absurd to suggest that just because I support HR-2346, I therefore hate CB'ers. HR-2346 is not anti-CB legislation. Instead, it is legislation designed to address those who abuse the citizens band radio service through the use of improper radio equipment, or improper radio operations.

> [snip] Dwight [snip] hammering out his vengeance on the
> CBers in misc.transport.road, misc.transport.trucking,
> and of course rec.radio.cb,

Sir, you really are a liar. I've never posted a single message, on any subject, in either one of those transport newsgroups. In fact, neither of those newsgroups are even listed as available through my newsgroup server. Therefore, not only do you lack overall credibility, you don't rate very high as a truthful human being either.

So what's the problem? Bill N. is correct. Some antenna systems operate with a high SWR. A long wire fed with ladder line is a good antenna and a high SWR is expected, that is why it is fed with a tuner and the antenna works very well. You show your ignorance of the subject.

twistedhed@webtv.net wrote:

Within the context, his statement is absolutely correct. Again,
multi-band operation is the largest single difference between Amateur and
CB practice.

While we are on the subject, the input impedance of the universe is 377
ohms. You want standing waves, the near field of your perfectly matched
antenna is cluttered with them. Given that the base of a non-loaded
vertical is about 34 ohms and extends to something like 1000-3000 at the
tip, it sure as hell has a 10:1 mismatch at various points along it.

All in how you look at it and what the problem is.

Dick NBK

Phil,

Congratulations on being one of the only people
in the usenet newsgroups able to properly address
the situation surrounding the controversy regarding
HR2346.

I know that in 1974 during the gas crunch that the Electronic Industries Association was under economical pressure to keep the end costs of their consumer electronic equipment to a baseline figure but at the same time had to do something to offset the rising cost of petroleum byproducts used in the manufacturing of same, namely plastics, so they eliminated the curcuitry necessary to prevent such anomalies as front-end harmonic and fundamental overload to said equipment. Now, I'm not saying there was any type of a conspiracy going on here, but if memory serves me correctly, wasn't the FCCs enforcement budget sort of lacking in or about that same time frame?

<snipped>

I had never heard the "story" about the feingold papers, or the story behind what got the ball rolling. Another case of some supposed protection in exchange for our rights via the usual path of "usurpation" of federal authority by the states". Now I am hearing that the newly created "Federal Motor Carriers Safety Administration" is confiscating export radios from truck drivers out on the roads, I just don't know what "authority figures" they are using to enforce this. I suspect it's probably DOT or local law enforcement. Not sure yet but more information should be forthcoming. I have been told that the officers have detailed lists of the manufacturers model names and numbers at the inspection points. Unless the driver can provide a copy of an amateur license authorizing voice communications in the 10 meter amateur band their equipment is being confiscated "on the spot"!

Soon....more updates on my web site at:

http://www.angelfire.com/az/firecommunications/

Very 73,
NAO911/Jack

Before we go much further, Don, please be informed that I AM
a communications attorney specializing in this field.

The FCC requires licensees (including legal CB/FRS/MURS/Part 15
device operators who are covered under blanket authorizations)
to cooperate to the extent of making reasonable transmissions
to enable the affected device owner's technician to determine
the effectiveness of suppression/protection measures.

A good way to attract lightning from the FCC for operation
"not in the public interest" is to not so cooperate.....

I know this to be a fact because when I was on the FCC staff
(District Director, San Ftancisco) I and several of my
counterparts in other districts initiated the policy and
it became nationwide many years ago.

In fact, the Federal Courts of Appeal have held that even THEY
do not have jurisdiction to hear nuisance or damage cases
arising from interference complaints - that only the FCC has
jurisdiction where interference is alleged - and they cannot
and will not hear any case except an appeal from a FCC ruling
and then only on procedural grounds, not factual grounds.

The subject is swr, NOT ladder line OR antenna tuners to bring it in line. How many cbers use ladder lines for normal communicatios? And don't tell me about hammies that use them AND cb. This is the cb ng, and if you stopped trolling long enough and took the time to see what room you were posting to this time,, you would realize this. I wondered how long it was gonna take you to try and wave your stink my way! You bring your little 10 to 1 swr on cb and you pick the freq, you ain't even gotta talk, JR, since we know you will be breaking the law, we wouldn't want you outted as a lawbreaker. (I know more than you would care to guess.) Just give me a time and a freq and you go ahead and deadkey with a swr of 10 to 1 for one minute, see if anyone hears your deadkey on the eleven meter. I'll even make the announcement for you that you are about to do it. See who hears you.
You could damn near utilize a piece of wood for an antenna with an MFJ tuner in theory, but the notion is ridiculous on cb. The post appears to lend credibility that a high swr on cb is ok. It is not, for optimum performance. There are exceptions to just about every rule. Please tell me where this appies to cb.
If I missed anything, I am sure you will defa...er, let me know.

> posted three messages about this subject since the passage of HR-2346
<snip>

More than 50 (closer to 150, but I'm trying to be conservative) cross-posted replies split between TWO MISC.TRANSPORT groups from a Technician Class individual with the call sign W5NET and the name Dwight Stewart arrived at misc.transport.road and/or misc.transport.trucking. The archived posts are available for anyone to count and confirm at Deja.com. I don't lie, sir.

Here are just a few excerpts from your 50+ posts to BOTH misc.transport.trucking AND misc.transport.road. I've already shown a good one from rec.radio.cb - but I'll include it again, since you felt the need to snip it from your response without explanation or admission. All excerpts (excluding the first) were found in EITHER or BOTH misc.transport groups you deny ever posting in.

I was just wondering something about HR-2346? Since this allows local legislators to write laws based on FCC regulations, will that include the forfeiture amounts spelled out in the FCC regulations? In other words, are we talking about local courts handing out fines up to $20,000 for each rule violation? If so, that will certainly encourage local law enforcement officers to go after CB'ers with a vengeance (there are very few $20,000 speeding tickets).

And I guess that is where we differ in our outlook. You see possible widespread police abuse, while I see a possible solution to a widespread abuse problem that has existed for years. With our different outlooks, I seriously doubt that we would ever agree.

If you don't agree with that, then I suggest that you gather up all your CB buddies and rush out to change those laws. However, don't count on my support - I agree with the laws in question (including the proposed one).

Therefore, I don't really share your concern. But, in the end, we'll have to watch this carefully to see how well it is working. Until then, I'm not worried.

Second, it should help to reduce the bad public impression that hobby radio in general has thanks to antics of the CB'ers over the years.

So, the only solution left is to allow local enforcement. In other words, in my opinion, even bad local enforcement would be far better than what we have now from the FCC (which is virtually no enforcement).

> Sir, you really are a liar. I've never posted a single message, on
> any subject, in either one of those transport newsgroups. In fact,

Especially not with the subject "Re: HR 2346 STATE & LOCAL COPS TO ENFORCE CB RADIO REGS" which was the topic in EVERY SINGLE ONE of the 50+ replies I reference. Strange that you wouldn't remember posting or replying there even ONCE.

-Ahem-

> neither of those newsgroups are even listed as available through my
> newsgroup server. Therefore, not only do you lack overall credibility,
> you don't rate very high as a truthful human being either.

Sir, if those groups aren't available through your server, I'd like to know how so many of your "Enforcement-By-Any-Means-Necessary" replies got there. YOU are a liar as well as a fool, sir, in denying what is so easily proven. Does your server allow you access to Deja, Sir? Go and reveal to your right hand what your left hand has been posting... SIR, before calling anyone a liar.

You called me a liar when I was only pointing out the myriad of reasons you and JR, of all people, would maintain HR2346's causative factor was primarily some Great Mandate of The Interference-Weary American People (which anyone without your bias should know is ridiculous) in direct contradiction of the more sensible and likely explanation given by a contributor with *actual professional background* and thus *qualification* and *credibility* you and JR did not and do not have as the result of your desire to see enforcement no matter how unwisely implemented. I put it to you yet again, having shown MUCH more proof than necessary to back it:

Dwight, you and JR are possessors of neither credibility nor qualification to speak to the causative factors of HR2346.

I agree Richard, that mismatches occur along many points, my point was that it is not conducive to cb radio operation to have a high swr that presents itself on the meter (let's assume the meter is close enough) and certainly nowhere near a 10 to 1 is deemed acceptable. I know they were talking about other bands, and yes, JR, I will admit my ignorance to a point about the other bands, see, I don't go there, so why would I care what happens there? DINGDINGDING! NOW I UNDERSTAND why you come here to play, JR!

Well, just think of how strange it seemed then, but not so much now.
While the "mine shaft" thing is a stretch, some of the CDMA and PCS
phones are getting pretty small and have very low power consumption
these days... Who would have thought that there would be so much
wireless infrastructure that these devices wouldn't need much direct
range? Direct satellite links are now a normal thing too. Maxwell
Smart's "shoe phone" was a sci-fi joke at the time, but it seems like a
complete dinosaur now - right? Even the oldest hand-held analog
cellular phones were more compact.

Hey all:

I'm looking to get back into the hobby after a hiatus of many years. Now that I have some money to spend, I'm pretty sure that I'll go for a nice base station, as opposed to a mobile unit [I already have a cheap RS mobile, anyway]. I'd like to go sideband, for distance.

Most importantly, I want to stay legal. Call me strange, but I like to play that way.

Anyway, I'm openly soliciting your opinions on this question: What's the best model in current production of a AM/SSB base station?

I've done a little looking around, and it looks as if the Uniden Washington may be the only one. Is this true?

Please reply here or via email to davelufkin@iname.com

Thanks.

Oh, is your antenna tuner connected right at the antenna? If not then all it is doing is matching the output of your transmitter to a mismatched coax/antenna system. Makes the transmitter see a good impedance but the mismatch between the coax and antenna is still there.

>
>
> Ladder line! yeah right when it starts to win shoot outs.

The juvenile practice of winning shootouts is not a concern of the ham community...communicating is. Ladder line is a good, very low loss transmission line, but you have to know how to use it, something far beyond your capability.

And you keep showing your ignorance of antenna systems. An SWR of 10:1 on certain antenna systems is perfectly acceptable and will radiate perfectly well. The cb crowd is so full of myth about SWR is is really funny. You will try to get a 1.5:1 SWR down ot 1:1 thinking you are really going to improve the signal. You can work you mighty little magic and get your SWR down to 1:1 and I will use a system where the SWR is say 3:1 and as long as I use a tuner to get max transfer of power from the transmitter to the coax and antenna, you won't see any difference in the signals on the receiving end. I did not wave my stink you way, you stuck you nose in it.

I just use a homebrew impedance bridge and it works fine. It cost me
about a buck and a half to build, and it's accurate to about ±10%.

The same rule applies to the cb band as any amateur band. You could just as easily use a long wire antenna fed with ladder line and a tuner, where the system operates with a high SWR. Why do you think that just because it is 27MHz that it won't work?

Electronically, most CBs nowdays are pretty much the same, and more
than half of other brand names are actually made by Uniden. It is more
a matter of personal preference and features. If you got the money,
get all the bells and whistles. But the most important thing to pay
attention to is the antenna, because at four watts, that is where your
signal will either fly or flop.

Hi there,

I'm a LEGAL Portuguese CB user and u know what??
At least in Portugal, I don't think there's a reason to pay the license (around $62.5 USD) as I've done.
- The restrictions imposed by who rules - or at least was supposed to rule - the CB use are very restrictive.
- We can have, as I suppose we all have all around the World, worst legal operators than some illegal ones. I think it's all a matter of being of some persons.

No matter what, you always find abusive, rude, ... CB users.

I hope you could get my point. My english skills aren't as u can see, great deal.

Best regards,

Madv
(Portugal, Lisbon)

Why don't you cite one example of our "contradictory stuff"?
Then, we could discuss it. You're just rambling here.

> Hey, the problem with the whole coax length issue is dealing with the
> antenna location. It's simply not resonate there, but just a few feet
> away, that very same antenna - *WHAM* BINGO - a 1:1 SWR - WHAZZAP?

If the antenna is not resonant, the SWR, by definition is not 1:1.
A "few feet" of coax will not change that. The SWR is still not 1:1.

There. I pointed out some "contradictory stuff" in your post.
Help us out here. Stop whining and explain yourself.
Stop posting this crap if you can't back it up.

On the contrary, you are posting the crap. This stuff about requring
18' of coax or varying the coax length to change the SWR is all
nonsense. You can't find one reputable text book to back you up.
But you still post it. You perpetuate the myths.

> Bother me later. When you have an understanding of what I'm talking

I see a lot of different thoughts in this thread and just wanted to mention what happened here in Rochester, NY, a few years back (less than 5, I don't remember exaclty when). Seems a guy heard noise in his garage. He looked out his second story window and someone was stealing a bicycle from his garage. He shot and killed the guy. It did not go to the grand jury. You may not use lethal force just for trespassing, but if someone is stealing (or damaging) property, the property owner CAN protect his property. It gets even easier if someone breaks into your house. I think that farmers have had a bad rap concerning shooting folks. They have a much larger area to protect, and some fools think they have to right to just do as they please. This can cause problems and my gut feeling is that property owners do have more rights than most believe.

73s from Rochester, NY
Jim

Interesting thought. Standing waves are caused by an impedance mismatch. It has nothing to do with resonance. A non-resonant antenna can indeed have an impedance of 50 ohms, and in that case the SWR would be 1:1. A resonant dipole has an impedance of 73 ohms, and a

-wave vertical is 36.5, neither of which will hand you a 1:1 SWR.

>Stop posting this crap if you can't back it up.

I did back it up.

Why is the transmission line not "behaving as predicted"?
Why is power "therefore" lost?

> standing wave is simply moved to a point along the transmission line

> where it cannot be detected.)

By the way, it says the standing wave has changed -- not the standing wave ratio (SWR). You can measure standing waves on a transmission line with a simple volt meter. That is what this article is referring to. An SWR meter, on the other hand, uses directional couplers to selectively measure forward power and reflected power which, as you admit, is constant all along the transmission line.

An SWR meter will render the same reading all along a transmission line because it is measuring forward and reflected power which are constant. A volt meter will show peaks and nulls of the standing waves as it is moved along the transmission line because it measures voltage which is the sum of the forward voltage and the reflected voltage.

> Now back to the transmission line. Granted no line is perfect. But a
> perfect coaxial transmission line will contain all the RF within the
> shield.

Yes (assuming no common mode currents).

> This is assuming that the impedance of the power transmitted
> through the line is equal to that of the line.

This doesn't make sense. Are you saying this came from the book? The characteristic impedance of the transmission line determines the relationship of the voltage and current of the power transmitted through the line.

> When it is not equal,
> as in the case of a standing wave, containment fails and the shield
> radiates RF.

This is not true. This didn't come from that book, did it? Standing wave indicate merely that you have power traveling in both directions on the transmission line. The voltages and currents of the two signals add together to produce what can be seen as standing waves. There is NO reason for the transmission line to radiate any RF. If it doesn't radiate when the signal goes up the coax, why would it radiate when a signal comes down the coax?

> If the transmission line is a multiple of 1/4w and
> positioned in a straight line, no harmonics are radiated.

This is way over the top. This can't be in the book. The power within a transmission line is not radiated regardless of the length. Also, a transmission line will not create any harmonics. It is a linear, passsive device which is incapable of creating harmonics.

Give me the exact quote of the paragraph that states this. Either it doesn't exist or you've got it way out of context.

> But as we
> all know, that is almost never the case. (In the case of mobile
> installs, however, the harmonics are generally contained within the
> vehicle).

What is this talking about?

> If this doesn't satisfy you, I guess you'll have to actually read a
> book, and then learn how to use a meter.
>
> Sparky, FLRC

Well, your book did nothing to contradict what I said about SWR --
Standing Wave Ratio. You've confused a "standing wave detector"
(a voltmeter in layman's terms) with an SWR meter. I know how to
use a meter and I even know what meter I'm using.

The part that says a transmission line's "containment fails" because
of standing waves is not true. I think you took a little too much
liberty in summarizing the text. Quote me the exact text verbatim
which you believe states this and we can discuss it.

Yes. Of course, you can obtain the impedance empirically
by measuring it.

Fred was telling me that my antenna was 37 ohms without
even looking at it. He must be psychic.

Don't worry about solving the coax question.

When I posted early in this thread that there
may be a usefulness to a18 foot section my
purpose was two fold. I knew that it would
stir things up. The two reasons were:

1. To tell it like it is

2. Most importantly get the newsgroup off the
"Illegal CB" or "Bash the CB"ers" threads and
back to what it is suppose to be.

With almost 50 follow ups I think number two is
working. Now for number one??????

(sigh) It's the way you respond, JR..like a chip exists on your shoulder or you have an ax to grind. Not me! Don't confuse me with the crowd that swears by flat line. I like a little movement in my meter, ever so slight, lets me know everything is working. I know the difference is negligible. Hell, I wouldn't give a damn if my swr was 1:8, matter of fact, it is if I go higher. I'm tuned for what some may consider objectionable, but I know the loss is so minute that it doesn't matter. You are correct, I stuck my nose in this one. But identical (ok, to be reasonable, lets use "as close as possible") setups side by side, with a 3 vs. a flat, and what is it 6 or 7 db to equal a "S' unit? I think I'd take ya' up on that challenge. Is there a chart, page or link existing anywhere that gives at least ballpark figures showing how much loss occurs with each increased step relating to each small increments of rising swrs without taking into other factors, such as coax, antenna, etc?

2437. Re: Yet another antenna myth

Of course you CAN, I never said it won't work. I took issue with the "high swr is acceptable on cb" idea as a whole, because simply put, I believe the audience of cbers actually utilizing this method is negligible and the ladder line will not outperform the majority of cbers base antennas.

Coax, these guys just don't get it. Dont they know that you know you could measure it but we were told the normal was 37 ohms if it is 37 ohms why do you need the bridge?

<anylength@willdo.com> wrote:

>Why is the transmission line not "behaving as predicted"?

What happens when you pump a 1500 ohm source into a 50 ohm coax? It
radiates. Try it.

>By the way, it says the standing wave has changed -- not the standing
>wave ratio (SWR). You can measure standing waves on a transmission
>line with a simple volt meter. That is what this article is referring
>to.

Really? How do you know if you haven't read it?

> An SWR meter, on the other hand, uses directional couplers to
>selectively measure forward power and reflected power which, as you
>admit, is constant all along the transmission line.

You are again forgetting phase.

>An SWR meter will render the same reading all along a transmission
>line because it is measuring forward and reflected power which are
>constant.

As I said before, try it. You will find out that you are wrong.

> A volt meter will show peaks and nulls of the standing waves
>as it is moved along the transmission line because it measures voltage
>which is the sum of the forward voltage and the reflected voltage.

Yes, according to the phase relationship. BTW, I have never tried to
measure it with a simple voltmeter, not that it matters.

>> This is assuming that the impedance of the power transmitted
>> through the line is equal to that of the line.
>
>This doesn't make sense. Are you saying this came from the book?
>The characteristic impedance of the transmission line determines
>the relationship of the voltage and current of the power transmitted
>through the line.

The characteristic impedance of the line is the voltage-to-current
ratio at which the line propogates a signal. You can feed the line
with any impedance, but if you feed it with an impedance other than
the characteristic impedance of the line, you will just lose power as
the line dissipates the excess voltage or current.

>> When it is not equal,
>> as in the case of a standing wave, containment fails and the shield
>> radiates RF.
>
>This is not true. This didn't come from that book, did it?

From the chapter on transmission lines, almost word-for-word.

>Standing wave indicate merely that you have power traveling
>in both directions on the transmission line.

Absolutely wrong. A standing wave is the _phase relationship_ between
the incident and reflected power.

> The voltages and
>currents of the two signals add together to produce what can be
>seen as standing waves. There is NO reason for the transmission
>line to radiate any RF. If it doesn't radiate when the signal
>goes up the coax, why would it radiate when a signal comes down
>the coax?

That question shows a complete lack of understanding of what a
standing wave is, and that you haven't understood a word I said.

>> If the transmission line is a multiple of 1/4w and
>> positioned in a straight line, no harmonics are radiated.
>
>This is way over the top. This can't be in the book.

It is. It is the application of antenna theory to the subject at hand.

>The power within a transmission line is not radiated
>regardless of the length. Also, a transmission line will
>not create any harmonics. It is a linear, passsive device
>which is incapable of creating harmonics.
>
>Give me the exact quote of the paragraph that states this.
>Either it doesn't exist or you've got it way out of context.

I have provided more information than I really wanted to, and I have
referenced all of it. Not only that, the same information is found in
five other books I own, and none of this is disputed in any of them.
Plus it is consistant with what I have observed over the past twenty
years in many different fields of radio, and can be proven by anybody
that gets off their lazy ass and trys it. I backed up what I said, now
you do the same. Because until you do I am not going to copy paragraph
after paragraph when all you are going to do is say that the book is
wrong, and do so without logical argument or reference. i.e., put up
or shut up.

Surprise, surprise, Twist. I agree with you 100%. Again, the issue is
that CB operation is single band where Amateur operation is multi-band. A
dipole with ladder line is a functional way to operate nearly everywhere
(at least within tuner range and not on some unmatchable freqs). The
antenna may operate as everything from a dipole to a top-loaded vertical
with some cute variations in between. Running balanced line obviously
requires some major attention to system balance. For CB it is complexity
without reward.

His point, and a good one, is that SWR is something of a fetish on 27 MHz,
generating complexity without reward.

illegal
> amplifiers,

No, what is funny is the fact that DaveMade pushes amps, and they have
people that do, but seemingly forget about the guy who only buys one or
two amps, and small ones.

Seems, if ya want to do business with the guys in DaveMade County USA,
you have to have deep pockets.

And that, my friend, is bullshit.

If they want to make people happy, provide customer service.

If they want to make a buck, fuck the customer after he spends his money.

but that is to be expected since you are part of there
> production line at xforce.

Blah blah blah.

DaveMade and their cronies have been pushing that line of shit for so long
that it gets worse and worse every time I read it.

Who gives a shit who builds what.

Bottom line. For 3 years, I have heard the common every day driver asking
questions and getting nothing in response... Especially since Dennis left
the news-
group (not Number 12, but Dennis at DM).

XForce always seems helpful.

That means a LOT to the guys who are spending their hard earned cash on a
small
2+4 or 6 pill.

But i am wondering where do all the davemades
> come from if there customer service sucks?

It comes from Dennis and the rest, who are busy building amps and NOT
providing answers to the questions.

Gee, X-Force has a good name, and a reputation for customer service.

So, I guess, a manufacturer can provide both, huh?

Someone must be happy somewhere
> since there are many out on the airwaves . Down here at our shop in Va we
> have a somewhat informed customer base they dont come to us asking how
> many watts will my amp do with a mirage 88 deadkeying 2.5 watts swinging
35
> pushing a 5 pill at 14.25 volts, well how about at 16.89 volts will it do
> the same. etc etc.

Thats great.

I guess these guys where born knowing all this information, too, huh?

Some people are so fucking narrow minded it makes me sick.

They know what they want If not they can buy a texas
> star , palomar, I dont need to sell them a davemade for the sake of
selling
> a amp

This comment you made above serves no purpose in the conversation.

If you sell someone a Texas Star just because they don't know how many watts
a Class C box will do at X volts, your an idiot.

You sell someone a Texas Star because they want clean, dependable power.

When i want to buy a rebuilt motor for my car i dont call Hendricks
> Motor Sports and ask them how many horses can I expect with one of there
> motors in my olds cutlass work car, how many miles to the gallon Ill bet
> they wouldnt even talk to me

I happen to know different.

My family has been involved in racing vehicles for over 40 years.

Most all engine builders spend the time to inform their customers, that way
people don't get pissed because they came in and ordered a motor with brand
X
pistons, brand Y cam with Z duration at A lift, and this carb or that fuel
injection
system.

Its called CUSTOMER SERVICE.

Your so far gone from reality it amazes me.

you ask why because i am not in thier league
> even though there motors are some of the best out there used on the
Nascar,
> Busch and grand National series.

Your now going to equate DaveMade to Nascar? Highly doubtful.

The people in the know will get thru to
> them and will get a great amp I don't think davemade wants to or needs to
> sell amps to the whole world maybe thats xforce amps goal. you had better

> bow down to the snake because without it you would still be using pirate
> amps in west Chicago.

Blah Blah Blah.

Bow down to this... Customer service always wins in the end.

People get tired of the "order, and get forgotten about" syndrome that
DaveMade
seems to have gotten as of the past couple years.

I am not downing their product, just the way they interface. They grab
people,
suck them into "their way of doing business", and make the guy with a
question
feel like a total asshole for asking it.

Give me a break. The world doesn't operate that way.

At least, not the real world..... Like Real World Electronics :)

I can't count the times when a driver has complained that his VHF
kicks whenever he keys up the CB, and then I find out that the coax or
install is crap. Run the SA in the cab and you'll find all kinds of
things floating around inside. Replacing the coax and reinstalling the
radio properly usually cleans it up.

*
*Standing waves are created by a mismatch between the load and the
*transmission line only. The source impedance does not affect SWR.
*
*> But when the transmission line is any multiple of a 1/4-wave
*> (times velocity factor, of course), that standing wave will not be
*> seen at the source,
*
*This is absolutely false. When there is reflected power at the
*antenna, it goes back to the radio regardless of the line length.
*To suggest that there is some length of coax that will make the
*reflected power disappear is nonsense. Where did the reflected
*power go?

****

If the source impedance is the same as the characteristic impedance as the line, any reflected power from the load is absorbed in the source and is dissapated as heat. Thus energy is conserved. Also some of the reflected power as well as the incident power is lost to heating of the coax depending or IR losses as well as losses contributing due to SWR.

****
*> and the reflected power is radiated through the
*> transmission line. This is something I have seen for over 20 years,
*> and it doesn't change just because someone says that it's impossible.
*
*"Reflected power is radiated through the transmission line"???
****

I agree power can only be radiated either by the load or the source. The transmission line will radiate power that is dissa-pated as heat not as RF.

****
*> >Keep this in mind. The SWR is, in essence, a measure of the percentage
*> >of reflected power.
*>
*> It is a measure of the percentage of reflected power seen at the point
*> being measured. Different points along the transmission line will
*> "see" differently, because of the nature of standing waves.
*
*Nonsense. If I measure forward power at the input to a transmission
*line, I will get the same forward power measurement at the output
*of the transmission line. Similarly, if I measure reflected power
*at the output of a transmission line, I will measure the same reflected
*power at the input to the transmission line. Power MUST be conserverd.
*
*An SWR meter merely measures forward power and reflected power to
*determine the ratio of the two. The power is constant all along
*a transmission line. Where could it go (or come from)?
****

In a lossles line yes. In lossy lines, power lost is by heat.

****

*
*You are really over the top here. Why would a shielded coax radiate?
*How can the RF pass through the shield?
****

If the net current in a closed area about a conductor is zero, the magnetic field is zero. Ampere's Law. Thus in a coaxial transmission line the currrent induced in the outer shield is 180 degrees out of phase of that induced in the center conductor. This will be in either direction power is flowing. Thus the net currrent is zero at any point on the coax. Net current of zero, no magmnetic field, no radiation.

****
*> Find a mismatched system and move a FSM or RF voltmeter
*> along the length of the transmission line.
*
*You are confusing common mode currents (currents on the outside
*of the transmission line) with the RF within the transmission line.
*We are not talking about common mode currents.
****

True. danhg those tricky common mode currents. hate them. they can be pains in the butt at times to gert rid of.

****
*> I might point out that it is usually better not to radiate your signal
*> from the transmission line because harmonics are easily generated and
*> your signal is wasted.
*
*Common mode currents certainly are undesirable. However, they
*generate no harmonics.
*

*>
*> Sparky, FLRC
*
*SWR meters are not sensitive to any "opposing reactance somewhere
*else in the system." Again, this is nonsense. All an SWR meter do
*is measure forward power and reflected power. Power is power.
****

SWR is best measured at the load. From that it is easier to calculate the actual load impedance if one knows where the minimums and maximums occur on the trasnmission line. But then that will require much more complex measurements than with a SWR bridge.

Firstly, the earth is moving through the shadow of the moon, not
the other way around. Secondly, sunlight DOES have a lot to
do with radio propagation by ionizing earth's atmosphere to
lower altitudes than it would be otherwise. This is why HF travels
farther at night, the reflective layer of ionization is much higher then.
As for the eclipse, since it is only partial, my guess is that radio
propagation will not be greatly affected, but who knows?
Perhaps the moon shadow will act like a local twilight?

So I got the shadow backwards, my niece and nephew were here
making a LOT of noise. As far as nighttime propagation, the
D layer is the one that absorbs RF. It fades rapidly after dark.

Yes.

> It has nothing to do with resonance.

Since a 1:1 match requires the impedance to be 50 ohms and
50 ohms is resonant, resonance is required for a 1:1 match.

> A non-resonant antenna
> can indeed have an impedance of 50 ohms,

50 ohms is, by definition, resonant. There is no imaginary
component in the impedance so it is resonant.

> and in that case the SWR
> would be 1:1. A resonant dipole has an impedance of 73 ohms, and a
> ½-wave vertical is 36.5, neither of which will hand you a 1:1 SWR.

Yes. Resonance does not guarantee a 1:1 SWR. However a 1:1 SWR
requires resonance.

> ...you are illiterate.
>
> Sparky, FLRC

Well, literate one, go use your literacy skills and look up the
definition for resonance.

Your observation may be correct but you are arriving at the wrong
conclusion.

It sounds like the scenario you witnessed was caused by common mode
currents. These are currents which flow on the outside of the
coax shield. The signals you are picking up aren't coming out of
the cable but rather down the outside from the antenna. This can
be caused by a bad ground or an inadequate counterpoise (ground plane)
for your antenna.

By the way, just as a note, the normal, desirable currents in a
coax are differential currents. The current in the center conductor
is equal and opposite to the shield current. The net differential
current (sum of center conductor current and shield current) along the
transmission line is always zero. Thus, it does not radiate.

Common mode currents, on the other hand, travel only on the outside
of the shield. There is no counteracting current to be found. So they
do indeed radiate.

This IS correct!!
>
> Interesting thought. Standing waves are caused by an impedance
> mismatch.
Not necessarily. Sure, it *can*, but a non-resonant antenna will do so
as well.
It has nothing to do with resonance.

The heck it don't!! If that were true you could run a 102" whip on
any band.

A non-resonant antenna
> can indeed have an impedance of 50 ohms, and in that case the SWR
> would be 1:1.
Yes, but rarely.

A resonant dipole has an impedance of 73 ohms, and a
> ï¿½-wave vertical is 36.5, neither of which will hand you a 1:1 SWR.
>
And you won't "tune" it by cutting coax, either!

Jerry

Your right Jay but it seems like we have to threaten to trash their NG every couple of week because they can't control their own. I just wish that all the fish in the CB ng would ignore their BS completely and then maybe they would stay in the Nintendo groups where they belong.

I think 'Doc was (wrongly) referring to the cap
in a negative feedback loop. Its purpose is
twofold as well. It blocks DC, and it also
sets the self-resonant frequency and bandwidth
of the loop.

Hi Toll.

Source record: 63812

A SWR of 1.5 is a 3% loss, and 3% in db is just about nil, so when u get it this low, it useless to try to gain anything by getting it lower.

The main reason for having a low swr is to protect the radio, but at the same time you end up having minimum loss , maximum transfer of the power to the antenna, thus maximum performance.

But even with lo or hi swr, the swr signal bounce off from the radio to the antennna, back and forth, zillions of times, and eventually is radiated by the antenna anyway .

A real joke: It is a shame you call yourselves hams!

What a bunch of bullcrap. Some bust! So where exactly did this happen? Did you hand him the "Seach Warrant" along with the "purposed local laws"? If the law is "proposed", you are in violation of harrassment laws & trespassing, at least. Why not catch real criminals (if thou fat ass can run after a real one)? If it were me, you would need to leave my POSTED property or risk removal by force if necessary. No discussion involved. All you anusholes did was intimidate someone while committing crimes yourself, no "bust" involved! The House Resolution is a bunch of bullcrap soliciting (& obviously getting) dumbass volunteer footsoldiers to fill the void of thier FCC Brownshirt rollovers who can't quite "get to it". You will need a Search Warrant to enter homes cause you cannot just enter unless the occupant is dumb enough to let you in. The resolution doesn't void the Constitutional protection from Illegal Search & Seizure. So you preyed upon an unsuspecting CBer, B.F.D.!

Maybe next, you will knock over a Spot-A-Pot with an old lady inside, in mid-squeeze, taking a big, fat Riley!

Rafman

That formula won't work for long.
If they want to make a buck and have an attitude
too (aka no customer service and/or talk down to
customers that don't have the required minimum
knowledge level), they will have to continue to
provide leading edge products that people will
want no matter what they have to go through to
get them.

Do they? Or is it their wise choice of distributors
that makes the difference? I believe it's the latter.
All DM (or any other serious amp builder for that matter)
has to do is associate themselves with a knowledgable
distributor that maintains enough of a presence here
(on the 'net in general) and can handle the PR (public
relations) chores in exchange for a piece of the profits.

DM had that and lost it to X-Force.

> That means a LOT to the guys who are spending their hard earned cash on a

> Thats great.

I agree. The above "Wild Bill" statement strikes me
as being self-serving, retarded, and probably false.
How can any shop have a "customer base" where every
guy has the answers to those kinds of questions? If
they can answer those questions, they don't need the
services of a shop--they can just mail order whatever
they want and build their own systems.

> I guess these guys where born knowing all this information, too, huh?

LOL.

> Some people are so fucking narrow minded it makes me sick.

Or so self-serving that they'll lie just to make
some minor point.

> They know what they want If not they can buy a texas
> > star , palomar, I dont need to sell them a davemade for the sake of

I agree. If they are that smart they don't need
the services of a shop at all.

> If you sell someone a Texas Star just because they don't know how many
watts
> a Class C box will do at X volts, your an idiot.

LOL.

> You sell someone a Texas Star because they want clean, dependable power.

And/or want to talk sideband, and/or don't want to
wait for some overpriced, custom amp to show up.

LOL.

> Customer service always wins in the end.

I agree. Plus, with the 'net being as mainstream as
it is, what were the "secrets" to building solid-state
comp amps with 12 volt pills are becoming common knowledge.
Believe it or not, there is a limit to what a 2879 can
be made to do. Dave doesn't have an endless stream of
tricks up his sleeve. In fact, pill-for-pill, there are
probably 3 or more builders who can get DM level per-
formance out of their 12 volt pill amps. That in and
of itself may be why Dave wants to distance himself from
that market. In other words, the "leading edge" in that
area is no longer solely his.

> People get tired of the "order, and get forgotten about" syndrome that

> feel like a total asshole for asking it.

See above. In my opinion, Dave never wanted to do
business that way (trucker and neophyte hand-holding).

> Give me a break. The world doesn't operate that way.

DM does--and it's not necessarily a bad thing.
With the "intrusion" of the Internet, it is
assumed that every company is a whore to the
"God Almighty Dollar." We're shocked when we
run across a company doesn't follow the norm.

> At least, not the real world..... Like Real World Electronics :)
>
> (end plug for Sean)

Sean's a whore. That's why he's not here anymore.
If Dave can live as comfortably as he desires without
being a whore, then he's got Sean beat by a country
mile.

On Thu, 14 Dec 2000 09:32:06 -0500, Handy Andy <CodysPC@Iserve.Net> wrote:

*Greetings!
*
*Whap! Whap!
*
*Hello, you guys are stuck with the "antenna" part. Never getting past
*the damn tree to see the forest.
*
*"Antenna System" because the antenna, now includes the coax. It's now
*the antenna! Yes, thats right. A simple unbalanced feedline now acts
*like a radiator. Ponderous thought isn't it?
****

If you can dispove Ampere's circuital Law then I will believe that a balanced or unbalanced transmission line can radiate. Andy you flat do not understand what you are talking about.

The net current induced by the forward wave has the current in the shield 180 degrees out of phase from that induced in the center conductor of a coaxial transmission line. Now we take a circle outside the coax at any distance greater than the outer diameter of the shield. Ampere's law states that the net current in a conductor will determine the strength of the magnetic field inscribed by the area of the circle. Well if the net current is zero, I don't care what form of standard acceptable mathematics will yield an answer other than zero magnitic field. No magnetic filed not radiation. SIMPLE. The same applies to the reflected power. In the coax we have two electromagnetic waves travelling along the coax. The direction and magnitude of those waves are determined by the cross product of the E and H fileds. It is these same E and H vector fields of the wave that induces currents in the inner and outer conductors. The same E and H vector fields also induce a voltage potential between the two conductors.

****
*[WOW!] You guys should check your glasses. You're not reading the
*textbooks expiration dates correct.
*
*Boy, you gotta' luv these guys...
*
*I'm not going connect all the dots for you. Many people believe what
*they want. I've taken the time to at least make an effort.
****

The problem is we don't know where your dots are and we flat don't have the time to find them.

****
*Quite wasting my time on this. If you guys can't figure out the
*difference between which end of the coax you should be using, then
*maybe you shouldn't post such contradictory stuff.
*
*Hey, the problem with the whole coax length issue is dealing with the
*antenna location. It's simply not resonate there, but just a few feet
*away, that very same antenna - *WHAM* BINGO - a 1:1 SWR - WHAZZAP?
****

Maybe you should take some time and really try and understand what is going on.

****
*Boy are you guys a lot of help - the answer to the problem in most of
*the cases is due to location.
*
*But, no...no one wants to cooperate and share the idea and focus on
*the end result.
*
*I have yet to hear anything of a logical answer to the kids question,
*from you or George. If coax length doesn't matter - you guys are
*really naive.
****

coax length has only an effect on the impedance seen by the source. It has nothing to do with the SWR on the transmission line. SWR is a constant that is derived solely from the characteristic impedance of the transmission line and the load impedance. If you place and SWR bridge at the source and adjust the coax length, you will find some length where the reflection of the load's impedance is equal to 50 Ohms. Gee the source is 50 Ohms and the SWR bridge is designed to work in a 50 Ohm system. Gosh I wonder why the SWR meter reads 1:1??????????????????????

Have you ever wondered ANDY??????????????????

It is because the source wants to see the characteristic impedance it is designed for. In this case it is 50 Ohms. Looking into the coax toward the load wee see a complex impedance that is equal to 50 Ohms. This also happens to be the charcteristic impedance of the line. The source is happy and all is well with the source. There are problems with this kind of matching.
1) It is generally a high Q match. That is a frequency changes rapidly the match condition will cease to exist.

2) It can degrade over time as the characteristics of the coax change due to ageing and exposure to the sun and mositure.

Now why does SWR change with the meter at the source and the coax length changes?

This can best be seen on a Smith Chart. The center of the Smnith Chart is 50 Ohms. We can plot the load's impedance on the chart. For this discussion it really does not matter what it is, as long as it is not 50 Ohms real or complex. Okay now that we have plotted the load's impednace, we need to draw a circle on the Smith Chart. The distance from the load to the center of the Smith Chart is

the radius of the circle. This circle is now our circle of constant SWR. This is made possible due to the fact that the radius of the circle is the reflection coefficient. The reflection coefficient is used to determine the SWR. Thus we have a circle of constant SWR since the load and the characteristic impedance of the coax remains constant. As we move away from the load toward the source along the circle of constant SWR there will be two points on the circle whose complex impedance will equal 50 Ohms. That is the square root of the sum of the squares of the real and imaginary parts will equal 50. These two points are arrived at by moving along the coax from the load toward the source. It should be noted that the two point will be half way arround the circle of constant SWR. Every time we move half way around the Smith CHart we have traveled one quarter of a wavelength along the coax. So from the load's impedance we now know two things:

1) the SWR
2) how far along the coax that two points where the load's impdenace ir reflected back to the source is equal to 50 Ohms.

It should be noted that the same two points are reached everytime we go a halfwave down the coax. Either one of these two points can be our starting point. Since the impedance seen looking into the coax toward the load is now 50 Ohms, the source is 50 Ohms, the SWR meter reads 1:1.

We can effectively move the SWR bridge along the coax. This is very easy to do. Just place a random length of 50 Ohm coax between the source and the SWR meter. remove the same length from between the load and the SWR meter to keep the overall length the same. Measure the SWR. Will it change?
Yes!
Why?????

We have now moved our measuring point a distance away from the source toward the load. Now let's go back to our starting point on the Smith Chart. We can see can go two directions along the cirlce of constant SWR. We must move along the circle in a direction towards the load. This can be seen on the outer edge of the chart. It tells you which way is toward the load and which way toward the source. We move along the circle so many portions of a wavelength. This is determined by the distance the meter was moved from the source in wavelengths. Now at that pointon the circle we now have a new impedance looking into the coax toward the load. It is no longer 50 Ohms. It will be some complex impedance though. There can be two values of pure resistance. Though it cannot be a pure 50 ohm resistance as the radius of the circle of constant SWR is greater than zero and 50 Ohms is the center of the circle. Now this impedance will be the controlling factor in mesuring the new SWR. It should be the the same value as plotted on the Smith Chart.

No let us return the SWR meter back to the source. Again we measure SWR and it is 1:1. One more note about this condition. We do not have a conjugate match condition.
Why?
To obtain a conjugate match we are matching the real portion of a complex impedance while cancelling the effects of the imaginary part. This can be done by presenting a load to a complex source that is equal in the real part and opposite in the imaginary part. This can been seen mathematically. Let our

source be R + jX. To conjugate match this part we would need to present a load of R - jX. This is not the case in the transfer of power via electromagnetic waves. Let's go back to the Smith Chart again. Remember we plotted a circle of constant SWR. The center line of the Smith Chart is the line of pure resistance. Our circle crosses it at only two points. Again since the radius of the circle is greater than zero, these crossings cannot be at 50 Ohms pure resistance. Also by moving the source a prescribed distance from the load there are two conditions where the impednace looking back to the load is 50 Ohms. They are a quater wave apart and the pair exist every half wave distance from the load. Yet when we replace the load and the coax with a 50 Ohm resistor we also have a 1:1 SWR reading. Interesting. In a conjugate match condition we can only have one solution for a given source. From the Smith Chart we see that we have two conditons R1 + jX1 and R1 - jX1 that gives us a 1:1 SWR. In practice we actually find three conditions. This would mean that we now have three solutions to a situation that says we should have only one. Instead we look to transmission line theory and we see that the source is considered matched to a transmission line when the characteristic impednace is equal to that of the source. The key word here is characteristic. We now can simplify our load and transmission line to one simple lumped impedance. If this is equal to the charateristic impedance of the transmission line and that equals what the source wants to see then we have a matched condition.

I never said he did lack them, Dick. I said that qualifications did not give Phil more credibility to speak about this issue in this newsgroup than anyone else, which I assume you would agree with. Or are you now saying that nobody in this newsgroup is allowed to talk about a subject if they lack the "proper" qualifications?

However, that is exactly what Phil was saying to JR when, after posting his own qualifications once again with his signiture, he challenged JR's qualifications by asking,"what professional background do you bring to substantiate your claims?"

I then went further to suggest that qualifications (of any kind) are not a clear indication that the person actually knows what he is talking about, which I assume you would also agree with. I went further to suggest that this is especially true if the person is wrong (which Phil is in this case).

Thanks to everyone for all the replies to my original post. I hope I didn't get everyone too stirred up with the original question. I'm just a simple electrician that knows little about radio stuff and was wanting to put a chunk of cable between the antenna and radio and have it work reasonably well :)
I guess there is a lot to learn about this topic.

Here is the case I was thinking of:
From www.arrl.org:

Mississippi Ham Awaits Court Decision in RFI Case
NEWINGTON, CT, Oct 29, 1999--A Mississippi ham arrested for interfering with his neighbors' telephones is awaiting a decision on his request to throw out the complaint on the grounds that the state court has no jurisdiction in the matter. ARRL member Bennie Stewart, KJ6TY, of Meridian, was arrested and charged September 10 after a neighbor filed a complaint with the Lauderdale County Justice Court.

Stewart, a ham for 12 years, appeared in court October 26. He says his attorney, Felecia Perkins, filed a request to dismiss the complaint, brought under a Mississippi law that makes it illegal to "intentionally obstruct, injure, break or destroy, or in any manner interrupt any telegraph or telephone line or communication thereon between any two points." Stewart has maintained that only the FCC has jurisdiction, and his station is operating properly. The case has been continued while the court mulls its decision.

Stewart's neighbors also were in court but did not have an opportunity to speak. "My attorney told me, 'Your neighbors are mad because you're not going to jail'," Stewart said. If convicted, he faces a fine of up to $500, six months in jail, or both.

Stewart said the prosecutor had wanted a group of hams to inspect his station, but he said one of the group that was supposed to conduct the inspection called him Thursday to say the group had decided not to get involved in the case.

"It should have never gotten to this point in the first place," he says, adding that he's tried to work with his neighbors regarding

telephone interference ever since the first complaints arose three or four years ago. "I put myself on a schedule," he said, operating on 40, 20, and 10 meter SSB only on weekdays between 8 AM and noon when his neighbors were at work. He says he never operates on weekends. Stewart says he stayed off the air for a while after his arrest, but he has since resumed limited operation.

He says he runs a Kenwood TS-440 barefoot. Although he does have a beam, he says he got rid of his Heath SB-220 linear amplifier after the RFI complaints surfaced.

"The problem is not here," he says of his station.

A retired professional photographer, Stewart--who's 60 and confined to a wheelchair--spent ten years in California after his retirement, but he moved back to his native Mississippi in 1993. His arrest shocked his friend and generated a lot of media attention. "My phone hasn't stopped ringing," he said. The case also has attracted the attention of the Amateur Radio community.

Stewart described his arrest--which he says took place in front of his three-year-old granddaughter--as a traumatic experience.

"It was humiliating," he said. "They bodily arrested me, and I'm in a wheelchair!" Stewart said he was taken to the sheriff's department, where he was booked and a mug shot taken. He had to post a $500 cash bond to avoid spending time in jail, he said.

Up until now, Stewart says, he's had no problems with the law. "I've never had a parking ticket," he said.

The pending legal issues aside, Stewart said he has tried several ways of dealing with the interference complaints beyond restricting his operating hours. He said he invested $175 in a 900-MHz cordless telephone that proved to be totally interference-free when installed at one complaining neighbor's home. Stewart says he offered to let the man use the telephone indefinitely as long as they both lived in the neighborhood, but the man refused the offer.

He's also offered filters, different telephones and other remedies, but says his neighbors have refused to cooperate.

Stewart says he expects the court to rule on the case very soon.

Well Dwight some people realize that its not just that you have
something to say, it's WHAT you say.

> However, that is exactly what Phil was saying to JR when, after
> posting his own qualifications once again with his signiture, he
> challenged JR's qualifications by asking,"what professional background
> do you bring to substantiate your claims?"
>

Commonly the guy with the best qualification gets to set the pace.If
anyone here is situated so as to be credible at asking another's
qualifications, it is Phil. It is NOT you. Of course you may say what
you wish, with egg accumulating on your face according to the extent of
your, well, cluelessness.

> I then went further to suggest that qualifications (of any kind) are
> not a clear indication that the person actually knows what he is talking
> about, which I assume you would also agree with.

You would ass-u-me wrong.

I went further to
> suggest that this is especially true if the person is wrong (which Phil
> is in this case).

So you know that what you say is exactly correct and that what Phil
says is not.
Yeah, Right, Dwight!

One of these days you'll probably walk into a Mack truck that you were
sure was only a mirage.

Again, you are a liar. I will repeat what I said before - while I have certainly never posted anything about HR-2346 in those newsgroups, I have never posted a single message, on any subject, to either of these transport newsgroups. Again, neither of those newsgroups are even listed as available through my newsgroup server.

In fact, I just checked with Deja.com to see if someone was using my callsign, or my name, in these newsgroups and it verified that there were no posts under the name "Dwight Stewart," or under the callsign "W5NET," in either of those newsgroups. If anyone would like to verify this for themselves, click on the link below and enter either my name or callsign in the search block.

http://www.deja.com/usenet/

I've posted a lot of messages over the last six or seven years, so don't be surprised at the number of total messages to search through (I was). If you want to make the search a little easier, enter the word "transport" after either the name or callsign to narrow the search.

You can also search for both "Dwight Stewart" and "HR-2346" to see that I was correct when I said that I've only posted 3 messages about HR-2346 since its passage in the rec.radio.cb newsgroup, instead of the hundreds that RadioFree claims.

> Especially not with the subject "Re: HR 2346 STATE
> & LOCAL COPS TO ENFORCE CB RADIO REGS" which was
> the topic in EVERY SINGLE ONE of the 50+ replies I
> reference. Strange that you wouldn't remember posting
> or replying there even ONCE.

Oh, so that is the crap that you're talking about. You need to get your facts straight (and learn how to use deja.com). That was a thread in one of these ham radio newsgroups about 3 months ago that appears to

have been crossposted to those newsgroups. In fact, if you read some of the messages, you'll see that I was talking to ham operators (Cecil, David Little, Phil, etc.).

Again, I've never posted a single message directly to those trucking newsgroups. To verify that, search directly in those newsgroups using my name or callsign (which will only list messages directly posted to a thread in those newsgroups, not crossposted messages in a thread from another newsgroup). I cannot be held responsible for where messages I've replied to were crossposted.

But, regardless, since those messages were posted three months ago (prior to the passage of HR-2346) how do those messages support your claim that I was "announcing the passage of HR2346 with a big grin and wielding it like a club in every group that could possibly be of interest to CBers?"

> You called me a liar when I was only pointing out
> the myriad of reasons you and JR, of all people,
> would maintain HR2346's [snip]

No, I called you a liar because you claimed that I was "announcing the passage of HR2346 with a big grin and wielding it like a club in every group that could possibly be of interest to CBers." Which, in spite of the messages from a ham radio newsgroup discussion you found above (posted three months ago, prior to the passage of HR-2346), is a boldfaced lie.

My apologies. I personally like the code and frankly, it helped my general class wife save the life of a non-hearing man who was a ham. The man was in the hospital and was fortunate to know that my wife had just received her general class license. During a breathing emergency one evening, he was able to tap out
his symptoms to my wife, who relayed to the physician on call. The code was his only reliable communications device, so I think that it's use in a movie is appropriate. And yes, there are lots of hams behind the scenes of movies that get ham "plugs" placed into the script. I think morse code will always have a place, in the same
manner as bow-hunting, hand reloading of firearms, survival stuff (whatever that is), and many other things
which require a bit of study and skill to participate. The fact that the military has replaced ham operators in
favor of more modern equipment is really not the death knell for the code. My personal form of communication
at the moment is 5 watt am cb - line of sight. Something romantic about talking to some stranger 20 miles away for me... Anyway,,,the movie was fast paced, filled with well done gags, and went by very fast. Not quite as good as "Cliffhanger" which was super exciting, but good, nevertheless.

My main gripe about CB is that if you speak well, and don't have an echo on your signal, and you have a nice,
clear signal, literally NO ONE will talk to you....I
mean.....Shit..!.......

Thanks for the well reasoned resonse to my perhaps to hastily formed reply to your post....

James,

You certainly are AN independant. First off, republican is NOT spelled
with a K. Secondly,
it is not proper to start a sentence with "IF so then." Thirdly, you should
investigate the
difference between "AND" and "AN."

Jeff

I want to erect a 1/2 or 5/8 wave vertical ground plane antenna at home to use as a base station antenna. My problem is that where I live is rented and I doubt that either the landlord or the neighbours would approve of such a large antenna sitting on top of the roof. At the rear of the property there are several large trees in which I could hide the antenna. My question is: Would being surrounded by trees effect the efficiency of the antenna? The land slopes rather steeply from rear to front so the house wouldn't really block the signal.

You're high as a kite! Show me one authoritative source that says "50
ohms is, by definition, resonant." Hint: there isn't one, because
there is no fixed impedance for resonance - the two are mutually
exclusive.

And I suppose a 50 ohm fixed resistor is resonant too . . . hahaha!

Sparky, laughing hysterically.

John,
Anything around an antenna can/will affect it to some extent.
How much it is affected just depends. With the idea that anything
is better than nothing, you might try it ans see how it works.
An alternative is to ground mount the antenna in your yard, as
far from surrounding objects as possible.

Just to toss out an option, take a look at the CCD antenna. They
require a lot of work to build, and require an antenna matching unit
and ground rod, but the results are fantastic. You can hang them
almost anywhere and in any position, they have very low noise and very
low angle of radiation. I built two of them, one for my base, and the
other is portable and can be hung in minutes.

John, a few things things to keep in mind...if putting the ant. in a tree the most practical of your limited options than go ahead and do it, just make sure you pull out all the stops when it comes to mounting because you dont want the antenna to come down in a year or 2 in a big storm.Depending where you live also....keep in mind that in the summer the moisture in the leaves on the tress may SLIGHTLY effect your performance on tx/rx and/or SLIGHTLY rise your SWR. One more thing, if you live in a climate with below freezing winters expect to have problems on TX and SWR when snow or freezing rain lands on the branches surrounding the antenna, but all in all it sounds like a good idea to throw the ant. up in a tree in your situation, good luck and 73's.

I have had a Big Stick in a tree for the last 22 years and it seems to do very well. Although being that I am in the north east and the leaves hide the antenna during the summer, I am not able to decree very much difference between the signal readings from the regulars that I talk to between the winter and summer. I do however, believe the doc is right. My antenna is in an old oak tree, if I were to put it in a pine tree I think the pine sap would create a sort of capacitance with the ground and suck off some of the signal. Being that as it may, any antenna is better than no antenna! Happy Holidays all!!!
The Antenna Man

Well a 5/8 wave for 11 meters would definitly be to BIG to put up in a tree. The way I did that one was to use the most practical choice...a 1/2 vertical dipole...otherwise known as the "antron-99" or a clone. Most 1/2 wave verticals for CB are alike in many ways as far as performance. one isnt necessarily better than another. You really dont need a ground plane kit for it either...not necessary and you wont notice anything different. I have been into ham radio for 11 years and have done work with alot of antennas. Most cb'ers dont know the difference between a 1/2 wave and a 5/8 wave. The 5/8 wave is definitly a better gain antenna but for 11 meters, antennas cut for this area of the spectrum ar very BIG and UNWEILDY. Better suited for a tower or rooftop. Well anyway, i mounted an antron to a 15' section of pipe, a 10' and 5' radio shack masts put together. i drilled holes in the pipe straight through at 3' intervals. that way, when i snaked it straight up the tree from the ground, against the trunk i secured it to the most vertical section of the top of tree i could get to. the 15' mast helped get the antenna above tree top. it wasnt a real tall tree, about maybe 35 to 40 feet high. i ran nylon rope thru the drilled holes and around the branch that was most vertical so antenna would look straight. these holes and the rope going thru stop antenna from spinning and falling out of tree. just tie the rope tight around branch. then secur coax with a little extra slack so it doessnt hang down and pull out of connector. leave enuff slack to allow for tree movement in winds. then run coax into house. anyway, thats the way i did it and you can tie another rope to antenna top, climb as high in tree as you can, then pull antenna up tree using rope. bob

Greetings!

On Fri, 15 Dec 2000 05:01:51 GMT, while the modem was ice fishing with
the Mouse, jdaggett@gate.net dissertated the following:

...[...]... a lot of stuff snipped

:+> coax length has only an effect on the impedance seen by the source. It has
:+> nothing to do with the SWR on the transmission line. SWR is a constant that is
:+> derived solely from the characteristic impedance of the transmission line and
:+> the load impedance. If you place and SWR bridge at the source and adjust the
:+> coax length, you will find some length where the reflection of the load's
:+> impedance is equal to 50 Ohms. Gee the source is 50 Ohms and the SWR bridge is
:+> designed to work in a 50 Ohm system. Gosh I wonder why the SWR meter reads
:+> 1:1??????????????????????
:+>
:+> Have you ever wondered ANDY??????????????????

Yes, and if you look at the ORIGINAL post I made, I never claimed
anything about what you're screaming about above. If anything, you've
confirmed what I've been saying all along. Which is what I care about,
and doing the Homework properly during the install prevents the issue
about what you and I are agreeing to - after all the shouting.

I just trim off the fat.

Thank you for re-interating what I said earlier. The only difference
is your "quote :source impedance" - which any common CB'er is going to
see. I see then end of the coax that goes to the radio. Simple...

My whole point? If you must use the antenna at the location you
choose, then you must accept the issue of having to make the system
appear resonate so you can operate the radio.

That may include adjusting the antenna

or

adjusting the length of the coax because of failure of above
to show low SWR during attempts to tune.

Now, if everyone can take a Valithium - we'll look at possible reasons
why a Manufacturer wants someone to use 18 feet of coax when the
manufacturer designed the antenna to at least be resonate with an
18-foot section of coax, even though the antenna is not resonate at
the location it's in due to poor ground.

Hint: Counterpoise is not equal.

There's two sides to every element...

stay tuned...

Regards!

Greetings!

Reflections, and Reflections Revisited - both from ARRL - I have a copy if you want the PDF of the latter. It explains not only the issue regarding coax length and use in antenna systems, but also SWR problems are not as serious as you think.

To quote verbatim is too lengthy. The end result is if the antenna can be made resonate using proper counterpoise - SWR should not matter. If the antenna is working a poorly designed or conductive counterpoise, you can have feedline radiation and possible damaging SWR - using coax to reduce the effect by adjusting the length to remove the unwanted reactive components, can at least provide a saftey margin for low-tolerant SWR equipment.

There! Give my regards to Gore...

Regards!

2524. Re: Yet another antenna myth

Newsgroup: rec.radio.cb
Date: 2000-12-15 15:29:28 UTC
From: Handy Andy <CodysPC@Iserve.Net>
Message-ID: <uqdk3tkdpmsg3ugirf6o62e3f16rc5kfq3@4ax.com>
Source record: 63906

Greetings!

Why make it more complex than it already is?

Why use a tuner?

Just tune the antenna for maximum F/S deflection - and SWR should be
low enough to be tolerable. Just use what the antenna maker wants you
to use, thats simple 50 ohm mounting and coax hardware - let alone the
coax. [Co phasing is a little different]

I would like to continue using 50 ohm coax. Ladderline just isn't the
stuff dreams are made of in typical commutes back and forth to work.

Now, Ladderline on a base? You have my interest - It's not going
anywhere...;-)

One Important note though.

The owners manual of any CB radio recommends SWR of 3:1 can cause
transmitter damage. And many radios are rated for 30:1 SWR mismatch
transmitting time - rated in minutes...

Personal experience shows that rating to be a lot quicker - like a few
seconds!

On Thu, 14 Dec 2000 19:55:10 GMT, while the modem was ice fishing with
the Mouse, JR <jr@some.net> dissertated the following:

:+> And you keep showing your ignorance of antenna systems. An SWR of 10:1 on
:+> certain antenna systems is perfectly acceptable and will radiate perfectly
:+> well. The cb crowd is so full of myth about SWR is is really funny. You will
:+> try to get a 1.5:1 SWR down ot 1:1 thinking you are really going to improve
:+> the signal. You can work you mighty little magic and get your SWR down to
:+> 1:1 and I will use a system where the SWR is say 3:1 and as long as I use a
:+> tuner to get max transfer of power from the transmitter to the coax and

I agree bill. when i first got on here about 3 or 4 years ago, that is the first time i heard of davemade. considering sonny was in retirement and no one i knew of around here was building , i decided to get a m800 from them. that experience was good. the amp is good quality and built like a boat anchor. however, it has also been my experience that they do have a attitude and it seems one hand doesn't know what the other is doing, especially when you start asking questions about their products. i think they make good stuff, but they are very slow to help you, to answer questions, and seem to have this 'don't give a damn attitude'. which is surprising. if they were more helpful, lowered their prices, and sped up their communication with potential customers, they would do better. but i get the feeling they just don't care about what anyone thinks or says. if they think they are king of the hill, it is a mistake and only a matter of time before this will be passe'. looks like xforce has taken the ball and ran with it, but i think these prices are way out of line,....cd is out....

Greetings!

No, solar radiation in excess causes skip. You might see some
interesting if not awe inspiring glimpes at the suns corona or be able
to see ejecta and prominences off of the suns limb - but skip event
[if you're talking 11 meters] is due to solar radiation from the sun.

Maybe you're confusing this with EME - Earth Moon Earth bounce?

[Reflecting signals off the moon and back to earth.]

Dave,

I use a Uniden Washington with an I-Max 2000 antenna. If you use this setup

you will have a hard time staying within FCC's 155 mile rule :)

73's

Greetings!

Your quite welcome Andrew.

As you can see, we all agree on one point...

Tune your antenna.

Others agree on other points, myself included,

Install the antenna properly.

While others, including myself, have a widely varying opinion on just
what to answer regarding the 18' included in the message...

Some say it don't matter...

Some don't care...

Myself, I have my reasons why I say the things I do.

We just waste a lot of bandwidth with the finer points that maybe
someday you can see for yourself. ;-) It's not hard to see the answer,
many people just have a differeing viewpoint about it.

Right now, put that antenna up, hook up the radio, tune it all up -
and enjoy the time you have for it.

Happy Holidays!

The Texas Ranger TR-696F-SSB is the current "biggest & best" of the FCC approved base CB radios available today. It has a 6 digit freq counter, dual meters, variable talkback, weatherband & more. The Washington is a less expensive alternative, & is the only other FCC approved CB base currently being made.....

Been there, done that......
Used to have a neighbor whose phone would get trashed every time my kids would use their 40 channel Walkie-Talkies... He refused to believe it was his $100 Cobra cordless phone that was at fault (maybe, seein' as how it was a Cobra, it was DESIGNED to also pick up CB!). What eventually convinced him to try a different phone was my bringing over an unaffected (RFI-Proof) phone from my home and plugging it in at his home... Voila! NO RFI.. even with the base station running.

I've used toroidal chokes and other methods over the years to help neighbors with RFI prone TVs, stereos, and phones with pretty good success. For phone RFI, you can go to the phone company for some relief by requesting a line filter on the main line that enters the home.... usually provided free of charge. When it comes to other appliances in your neighbors home, I've offered to help with advice, but I don't get personally involved in the installation of filters and such. I've found that personal involvement will only get YOU blamed should that appliance fail later (...musta' been your modification that ruined it, right?).

go to a major local library and see if they have Howard Sams on hand and photo copy it. There is a catalog and you find the right one. In your case you want CB-219. You might be able to get a copy of it from Howard Sams web page for about $20.

IIRC the Stewart case was dismissed for lack of jurisdiction
(as some of us has been claiming for YEARS).

I don't recall the exact number, but at least five Federal
Appellate Circuits have declared in cases referred to them that
the FCC has exclusive jurisdiction in radio interference
cases. There are 12 or 13 such Circuit Courts nationwide,
depending on whether one counts the US Court of Appeals for the
Federal Circuit, which deals in Federal Tax and Patent appeals
only. In general, one Circuit will defer to a finding in a
"sister" Circuit in matters which have not yet been brought up
in their own Circuit.

>the law is "proposed", you are in violation of harrassment laws &
>trespassing, at least.

Not if it's federal law, which it is - the locality would make a local law to make it easier for them to prosecute. Under federal law, the offender would have to appear before the federal magistrate so the town wouldn't get any of the "glory".

>If it were me, you would need to leave my POSTED property
>or risk removal by force if necessary. No discussion involved.

If the police believe that a crime has been, is being or will be commited, they have probable cause to come onto your "POSTED" property. The complaints of the neighbors is enough probable cause that a crime has been commited under the new federal law.

>You will need a Search
>Warrant to enter homes cause you cannot just enter unless the occupant is
>dumb enough to let you in. The resolution doesn't void the Constitutional
>protection from Illegal Search & Seizure.

I'm just curious - could someone who's a little more familiar with the law clairify if the law requires the officer to obtain a search warrent, or do they operate under the same authority as the FCC does to inspect you equipment at any time, thus negating the need for a warrant? If that's the case, without a warrant the cop couldn't arrest you for the crack you have sitting next to your CB, but he could take the illegal amp you're running.. again, I am not totally familiar with the law, so I don't know if they need a warrant.. anyone know?

You can if it is properly matched.

>> A non-resonant antenna
>> can indeed have an impedance of 50 ohms, and in that case the SWR
>> would be 1:1.
>Yes, but rarely.

Dummy loads aren't rare.

>> A resonant dipole has an impedance of 73 ohms, and a
>> ¼-wave vertical is 36.5, neither of which will hand you a 1:1 SWR.
>>
>And you won't "tune" it by cutting coax, either!

To a point. You can make a linear balun out of coax that will work
fine, but that usually requires a coax of a different impedance.

I think it's called a "Jailbird 5000". You can hook them up as a duplex
feed, using a standard 75 ohm splitter, in common with your TV coaxial
cable, thereby saving you the expense of buying a separate run of feedline.

Not sure who sells them, but if you give Riley Hollingsworth a call, or
email him at www.fcc.gov, he will surely point you in the right direction.

I heard that, I did there, Roger-D there good buddy there, May the good lord
take a liking to you there, all the good numbers there, your walking the dog
there, really blowing smoke there, we're off and clear there and back quiet
there...

A TV antenna is tuned for signals above 50MHz. Your CB transmits around 27MHz which would require an antenna that resonates at that frequency. A 3 element CB beam is about 11.5ft long and 18ft wide. TV antennas are too small and do not resonate at 27MHz.

The feedpoint of most TV antennas is also 300ohms, your CB needs an impedance match of 50ohms. TV antennas generally have a transformer to get your 300ohm impedance down to 75 for the type of coax it uses. CBs use 50 ohm coax.

Examples of 50 ohm coax: (for CB)
RG58
RG8/U mini foam
RG8
RG213
9913
LMR-400

Examples of 75 ohm coax: (not for CB)
RG-6
RG-59

The FCC may have the right to inspect your equipment but that does give them the right to enter your home without your permission or a warrant. I believe this is why they will usually show up with the local authority the second time with a warrant in hand. This is one of the reasons enforcement is so time consuming, costly and difficult. It will be one of the same problems the locals will have. They will have to prove just cause to the judge in order to obtain the search warrant. The fact that you have an antenna on your roof should not suffice. This Bill is a feel good bill and it will have little impact unless the Feds can tie some substantial dollars to it that will entice the locals to enforce it.

What are you talking about? I read what you posted.
If there is something to add to this, post it.

What you posted said that they used a "standing wave detector."
What it described was entirely consistent with using a simple
voltmeter and inconsistent with using a genuine SWR meter.

> > An SWR meter, on the other hand, uses directional couplers to
> >selectively measure forward power and reflected power which, as you
> >admit, is constant all along the transmission line.
>
> You are again forgetting phase.

Once you separate forward power from reflected power (as done with
a directional coupler), the forward voltage is in phase with the
forward current and the reflected voltage is in phase with the
reflected current AT ALL POINTS ALONG THE LINE. The relationship
between the forward (and reflected) voltage to the forward (and
reflected) current is the characteristic impedance of the transmission
line -- in this case 50.
Vf = If * 50.
Vr = Ir * 50.

Vf and If are in phase.
Vr and Ir are in phase.

> >An SWR meter will render the same reading all along a transmission
> >line because it is measuring forward and reflected power which are
> >constant.
>
> As I said before, try it. You will find out that you are wrong.

The theory says this is right and the theory is based on countless
observations and tests performed over many decades. If you can
correctly show otherwise, you will be a giant in the field and
rewrite all known theory.

The line does no such thing. I don't know where you have heard this.

Give it to us word-for-word. No almosts. I want to know exactly
what it says.

> >Standing wave indicate merely that you have power traveling
> >in both directions on the transmission line.
>
> Absolutely wrong. A standing wave is the _phase relationship_ between
> the incident and reflected power.

It is not wrong. If you have power traveling in both directions,
there certainly will be a phase relationship between the two.

If I am wrong, answer this question. How can you have standing
waves if you have power traveling in only one direction on a
transmission line?

I can't wait for your answer. Standing waves are, by definition,
the interaction of forward and reflected signals.

> > The voltages and
> >currents of the two signals add together to produce what can be

> That question shows a complete lack of understanding of what a
> standing wave is, and that you haven't understood a word I said.

What you say makes no sense and has no rational explanation.

And you still haven't answered my question. If a signal traveling
up a coax does not radiate, why would a signal traveling down a
coax radiate? As I correctly said, standing waves merely indicate
that you have signals simultaneously traveling both up an down the
coax.

> or shut up.
>
> Sparky, FLRC

I have put up. I've put up some basic questions that you cannot
answer. I've shot holes in your argument and you can't plug them.

You have said that you "summarized" the text that you posted.
I want to know what is says word for word -- no summaries.
Furthermore, you've injected your interpretations which aren't
even supported by the text you posted.

The SWR is constant all along the line and an SWR meter will read
the same SWR all along the line. You have not shown *anything*
that contradicts this. However, you claim it is not true (probably
from your misinterpretation of a "standing wave detector" for an
SWR meter).

This nonsense that a coax radiates with the presence of standing
waves is way over the top. I'd like to know exactly what the book
says to suggest this. If it indeed says this, I'll take it up with
the author. I won't make you defend his work.

Hey Sparky, you seemed to have conveniently snipped out an important
challenge. I'll repost it here to save you the trouble of going
back to look for it:

I wrote:
: Well, literate one, go use your literacy skills and look up the
: definition for resonance

Well, what is the definition of resonance?

Show me a resonant impedance that has a nonzero imaginary term.
There is none.

Yes, a 50 ohm resistor is not resonant but we were discussing
antennas. Weren't we?

Resonance implies that there are cancelled out reactances at
work. The net reactance is zero. That is, the imaginary
component of the impedance is zero.

An antenna passes through resonance when the frequency is varied
such that the imaginary part of the impedance passes from negative
to positive or from positive to negative. That is, when the
imaginary part of the impedance passes through zero. The antenna
is resonant at the frequency when the imaginary part of the impedance
is zero.

So, given this, what do you think an antenna is when its impedance
is 50 + j0 ohms?

Answer: resonant

Furthermore, the impedance required for an SWR of 1:1 is 50 + j0 ohms.
Given that 50 + j0 ohms is resonant and it is a *requirement* for
an SWR of 1:1, we can say
AN SWR of 1:1 REQUIRES RESONANCE.

Get it?

Your turn, hysterical one.

I'll say. He sees a "conjugate impedance" looking into the coax.
He has some sort of "conjugate equation" (I don't know what that
was referring to).
He gets a "conjugate matching scheme" with 18 feet of coax.

Smith Charts are handy; a nice RF design software package is nicer.
;-)

anyone know?
I am familiar with law in general(Not saying how) ANY Search needs a warrant...this warrant needs to state exactly WHAT they are searching for and WHERE their going to find and/or search for it! My bag of crack falls under a different area of the law and believe it or not...if this happened the person searched could get a GOOD lawyer and get off on the crack charges! You don't need to take my word for it...ask a COP or a LAWYER. It's kind of A loop hole...people who get busted know they did wrong so they don't fight it. NOBODY can search my house without a warrant stating what they are looking for...not even the FEDS!

> Oh, so that is the crap that you're talking about. You need to get

YES, that IS the CRAP I'm talking about which you (again) say NEVER happened but STILL deny after PROOF has been shown. Foolishly, cowardly, and in complete negation of any honor or credibility you may have thought yourself to possess.

> your facts straight (and learn how to use deja.com). That was a thread

My facts are *too* straight, evidently, and you seem to want to re-word your challenges to me without admission or apology now that you've been busted. I would say I am more familiar with deja.com than is comfortable for you.

> in one of these ham radio newsgroups about 3 months ago that appears to
> have been crossposted to those newsgroups. In fact, if you read some of

What's this? "Appears to have been crossposted to those newsgroups"? You mean those transport newsgroups? Your challenge to me was:

>I've never posted a single message, on
>any subject, in either one of those transport newsgroups. In fact,
>neither of those newsgroups are even listed as available through my
>newsgroup server.

Whether or not you realize it, your server has access to those groups if you have been crossposting messages to them. Unless you believe in magic. You challenged me and I produced. You're a *spankard* for not being *man* enough to own up to it, apologize for calling me a liar, and THEN re-word your challenge, if you thought it could help your position.

> Again, I've never posted a single message directly to those trucking

You've never posted a single message *DIRECTLY*... Usually the word "Again" precedes something you've already said. In this case it does not, and shows the re-wording I charge you with yet AGAIN... AGAIN, DO YOUR RESEARCH before calling anyone a liar.

Shame, thou dishonest and duplicitous SPANKARD!

This willingness of yours to dodge the facts to support your position is PRECISELY the reason I challenged your credibility. In all truth there was no need for me to reference any number of your posts in any newsgroup, but I did and have met your challenge with ample proof. Face it and get over it.

I have shown that your weak attempt to challenge a professionally qualified and credible individual's opinion as to the causative factors of HR2346 is a direct result of your CB enforcement fetish - no matter the cost to operators, legal or not, and regardless of the impact of "jurisdictional issues" which you (without any qualification to speak of) consider "nonsense".

Since your stated opinion is without question neither credible nor qualified (that HR2346 is primarily the response to some great mandate from the citizens at large), I am within my scope of understanding to take issue with *your* claim.

Simply put, if you think many folks outside hobby radio give a rat's tail about CB, you're suffering from delusions, misinformed, or driven by unreasonable bias. It's definitely all of the above in your case. You cannot speak on the subject objectively with any credibility at all.

I have already proven this main point. I will not be answering to your "new and improved" challenges, for your status as a backpedaling SPANKARD makes it unnecessary.

RadioFree

*:+> coax length has only an effect on the impedance seen by the source. It has
*:+> nothing to do with the SWR on the transmission line. SWR is a constant that
is
*:+> derived solely from the characteristic impedance of the transmission line
and
*:+> the load impedance. If you place and SWR bridge at the source and adjust
the
*:+> coax length, you will find some length where the reflection of the load's
*:+> impedance is equal to 50 Ohms. Gee the source is 50 Ohms and the SWR bridge
is
*:+> designed to work in a 50 Ohm system. Gosh I wonder why the SWR meter reads
*:+> 1:1??????????????????????
*:+>
*:+> Have you ever wondered ANDY??????????????????
*
*Yes, and if you look at the ORIGINAL post I made, I never claimed
*anything about what you're screaming about above. If anything, you've
*confirmed what I've been saying all along. Which is what I care about,
*and doing the Homework properly during the install prevents the issue
*about what you and I are agreeing to - after all the shouting.
****

What shouting. I thought I gave a very well thought out dissertatiion on what
happens when coax length is adjusted. I do not claim to be an expert, but I do
know something about the subject.

****
*I just trim off the fat.

*Thank you for re-interating what I said earlier. The only difference
*is your "quote :source impedance" - which any common CB'er is going to
*see. I see then end of the coax that goes to the radio. Simple...
****

I am not sure I really iterated what you said earlier by what you trrimmed of
was not fat.

Andy May I point out ot you that what I mean bt source impedance.
IT IS NOT WHAT IS LOOKING INTO THE COAX. The source impedance is the impedance
of the transmitter.

****
*My whole point? If you must use the antenna at the location you
*choose, then you must accept the issue of having to make the system
*appear resonate so you can operate the radio.
*
* That may include adjusting the antenna
*
* *or*
*
* adjusting the length of the coax because of failure of above
* to show low SWR during attempts to tune.
*
*Now, if everyone can take a Valithium - we'll look at possible reasons
*why a Manufacturer wants someone to use 18 feet of coax when the
*manufacturer designed the antenna to at least be resonate with an
*18-foot section of coax, even though the antenna is not resonate at
*the location it's in due to poor ground.
*
*Hint: Counterpoise is not equal.
*
*There's two sides to every element...
*
*stay tuned...
****

Oh I can't wait to here this. I need a good laugh. You are right about one
thing. In a mobile situation ground is poor and ground losses are higher than
say a ground mounted vertical. There really is no reason for 18 feet unless the
manufacturer of the antenna is doing something strange with the construction of
the antenna. The only poossible scenario is that when using load coils in the
construction, the antenna is designed to be highly inductive. In this manner the
feed point impedance maybe raised such that a specific length of coax will
transform that impedance to 50 Ohms. If that is the case then that is truely a
poor design. As I stated before, that type of matching is good if one were to
operate over a very small band of frequencies. That technique worked well when
the CB band was only 23 channels. For 40 channel and beyond then there are
better means than requireing a fix cable length. IF a manufacturer does require
this, then in my opinion, that is a poor designed antenna.

regards
james

there is a scheme that can use the TV antenna as a capacitance top hat. But one thing about that scenario is that noone will be able to use it for anything else. Thus you will not be able to watch tv especially when tranmitting on the CB. Besides after all the work to get it setup and operating, you could just put up a thin peice of wire about 18 feet long and do better. Granted it can be done but ther are much better approaches. I would only incorparate a tv antenna as a last resort.

>Again, you are a liar. I will repeat what I said before - while I
>have certainly never posted anything about HR-2346 in those newsgroups,

Your name and HR 2346 in the searchbox at deja.com will show the transport threads you claimed NEVER to have posted to. That was your challenge and you have been busted. You are positively *pathetic* in your attempt to blame me for your mistake.

> > Especially not with the subject "Re: HR 2346 STATE
> > & LOCAL COPS TO ENFORCE CB RADIO REGS" which was
> > the topic in EVERY SINGLE ONE of the 50+ replies I
> > reference. Strange that you wouldn't remember posting
> > or replying there even ONCE.

> Oh, so that is the crap that you're talking about. You need to get

YES, that IS the CRAP I'm talking about which you (again) say NEVER happened but STILL deny after PROOF has been shown. Foolishly, cowardly, and in complete negation of any honor or credibility you may have thought yourself to possess.

> your facts straight (and learn how to use deja.com). That was a thread

My facts are *too* straight, evidently, and you seem to want to re-word your challenges to me without admission or apology now that you've been busted. I would say I am more familiar with deja.com than is comfortable for you.

> in one of these ham radio newsgroups about 3 months ago that appears to
> have been crossposted to those newsgroups. In fact, if you read some of

What's this? "Appears to have been crossposted to those newsgroups"? You mean those transport newsgroups? Your challenge to me was:

>I've never posted a single message, on
>any subject, in either one of those transport newsgroups. In fact,
>neither of those newsgroups are even listed as available through my
>newsgroup server.

Whether or not you realize it, your server has access to those groups if you have been crossposting messages to them. Unless you believe in magic. You challenged me and I produced. You're a *spankard* for not being *man* enough to own up to it, apologize for calling me a liar, and THEN re-word your challenge, if you thought it could help your position.

> Again, I've never posted a single message directly to those trucking

You've never posted a single message *DIRECTLY*... Usually the word "Again" precedes something you've already said. In this case it does not, and shows the re-wording I charge you with yet AGAIN... AGAIN, DO YOUR RESEARCH before calling anyone a liar.

Shame, thou dishonest and duplicitous SPANKARD!

This willingness of yours to dodge the facts to support your position is PRECISELY the reason I challenged your credibility. In all truth there was no need for me to reference any number of your posts in any newsgroup, but I did and have met your challenge with ample proof. Face it and get over it.

I have shown that your weak attempt to challenge a professionally qualified and credible individual's opinion as to the causative factors of HR2346 is a direct result of your CB enforcement fetish - no matter the cost to operators, legal or not, and regardless of the impact of "jurisdictional issues" which you (without any qualification to speak of) consider "nonsense".

Since your stated opinion is without question neither credible nor qualified (that HR2346 is primarily the response to some great mandate from the citizens at large), I am within my scope of understanding to take issue with *your* claim.

Simply put, if you think many folks outside hobby radio give a rat's tail about CB, you're suffering from delusions, misinformed, or driven by unreasonable bias. It's definitely all of the above in your case. You cannot speak on the subject objectively with any credibility at all.

I have already proven this main point. I will not be answering to your "new and improved" challenges, for your status as a backpedaling SPANKARD makes it unnecessary.

The police would mark them and use them for controlled buys.

The FCC would destroy them.

From: Pete <pete@keirle.fsnet.co.uk>
Message-ID: <91efen$98q$2@news6.svr.pol.co.uk>
Source record: 63986

Hello, readers.
After a long break from the UK 11metre radio scene, I'd like to get back into the hobby again.
I started when CB radio first came to these shores way back in the mid-seventies. And yep -
I guess I'm a seasoned 'breaker'..! I turned to Short-Wave listening for many years and also got
into designing/building my own HF radio equipment.
Did I get into Amateur Radio..? Yeah but, apart from too many rules and regulations, todays
Amateurs have forgotten how to have fun. And radio can and should be real fun. (Just ask the
operators of the now-gone, Radio Caroline - Remember them... yeah, of course!)

Pirate..? Yep - that's me. I guess I been around for as long as the "Echo-Charlie" band. So that's
where you come in...
I'd love to own a Cobra 148GTL-DX again. Looking at these newsgroups I see a lot of good and
clever people still using AM/SSB and I miss all this. So do you or anybody you may know have
such a set which I could buy..? I'm not too bothered about the appearance as long as it's in a
reasonable working condition. I 'm interested in non-working sets, too.

Well, thanks for reading and I'd sure appreciate any help that fellow operators may be able to offer.

Thanks again, good luck and 73's...
Pete.

There are a lot of flamers on the ng. Many of them are hams. I have stated in the past that the flames do no good and, indeed, put off a lot of folks. For what is it is worth, I received an e-mail from a guy that asked if we had served together in Vietnam. We had. We are corresponding and I would ask everyone to remember that the whole world can see our posts. Go ahead and be an idiot, but it might be benificial if you are a reasonable individual and don't make flames. I'm having a ball recalling many incidents in the US Navy. Understand that there are a lot of decent folks that read the newgroups - don't be an idiot! For what it is worth, I have met a lot of CBers that could dust me - if you want to disagree, fine - come on, try and dust me! Lots of luck and best of 73's (to N8**** - I did NOT say 88 and I will not - and 73's can be taken as a singular collective!)

73s from Rochester, NY
Jim

2605. Coax Length [My view]

Newsgroup: rec.radio.cb
Date: 2000-12-16 01:30:04 UTC
From: Handy Andy <CodysPC@Iserve.Net>
Message-ID: <s9cl3t0en56uc05frh5ktlgetbhmcmiq9a@4ax.com>
Source record: 63989

Hi Folks.

All this message is for is my own appology for all that wasted bandwidth regarding Coax Length and if it's really necessary.

The truth is, Coax length shouldn't matter. If you find out that using a specific length takes care of the problem, you can either...

A. Live with it.
B. Take steps to correct the problem.

I see a widely varying range of different opinions and I'm not here to debate them. An open mind is needed, check the flames at the door.

The "colors" that this subject brought up has been interesting and downright funny at times. [Embarassingly funny - and I mean that, If I offended anyone - My Appologies.]

However, no one has taken a stance regarding the issue around mobile antenna installs and problems with location. Very few have noticed what I've seen for years regarding this Coax Length issue.

If it's in a bad location, you'll have SWR problems.

If the mount isn't the right one, or poorly done, you'll have SWR problems.

With the above two reasons, my experience has been to correct the problems by relocating the antenna. In virtually all of the installs I've worked on, this was the beneficial solution. Only in rare instances was the mount at fault and it's usually due to corrosion.

However, some people never budge on re-locating the antenna and so therefore the coax length issue comes up.

In my own investigation of this, the coax length issue means the antenna is not resonate due to a number of factors. Most, if not all, are associated with the counterpoise, or the conductivity and reactive components the ground plane provides, or works against the antenna, at that particular location on the vehicle.

Sure you can swap antennas, sometimes changing to a different loading scheme can work better at the location than others. But, are you willing to waste the time on that? Some do. However, some don't.

On my pages, I suggest using a simple mag-mount so the new CB'er can see how the antenna will look on the vehicle. There's more to that, the installer [namely me] can also locate areas that are better to use

the antenna at versus where the antennas owner wants to try it at.

An MFJ-259 is a handy tool for working out the locations fine tuning, you can see how the antenna will work at the locations tried.

So, why does an antenna work better at some locations on a vehicle than others?

Why does the SWR vary between locations on the vehicle? Ground? Metal panel not connected to the vehicle?

That is what piqued my interest. And my efforts to locate the information regarding this issue, seems to contradict what others firmly believe.

There is a reason for why things are done the way they are by antenna manufacturers. To ensure the user a viable means to use the antenna in a wider range of locations and environment conditions without suffering severe/critical damage to a CB radio.

The above, to me, is the most important advancement in the realm of antenna design and construction.

They are thinking about us folks. We're important.

I'm not talking about making it easier for us installers... nor are they trying to get us to buy coax by the truckload...

Far from it.

It's a liability. The antenna has to work in order to sell, it not going to make it in the real world if it fails.

------> It's so the user can use the radio to get help.

That, my friends, is the most important issue. If you have any questions about that, see the subject line.

This is what makes the NG so fun to be on.

My best advice to the new CB'er, don't make it hard on yourself. Take the time to read, review, learn about those claims the antenna makers will say. You can't avoid it. It's not going away.

The best clues are the antenna placards that have the installation instructions with them that can be read without having to open the package. Compare those instructions with others of the peg-boards at the local CB shop. A lot of dust on the shelves? Complain! You may need to go elsewhere. The people there at the store may not want your business if they don't keep items moving thru the store. A dusty item is a dead product.

Some will try to sell the antenna on the ease of tuning...
Some will try to claim their antenna puts out more signal...

Some will claim flexibility in mounting locations...
Some will claim they've been in this biz for XXX centuries...

All have valid points, but there is a difference, and it's within you to make the right decision. You have to put a system together, so choose carefully.

One such point is guarantee, will the maker stand behind the product, or just leave you standing there? Read the fine print.

Remember, the person that has to be made happy is you, no one else.

Can't stand the sales pressure? Go elsewhere. A dealer may have the right to sell antennas. However, they don't have the right to shove it down your throat.

If you are reading this message, then that means you have the ability to research. Take the time to read what those companies claim out here on the 'net. Their reputation is based upon their own knowledge base. If you're not getting the answers you need, look elsewhere. There are plenty of resources out here to help you.

Don't ever settle on the first one you see, take time to look at your options. Then if it's the one you really want - then go for it. Buy what the antenna needs for installation.

Don't settle for second rate, buy and use quality. You're selling yourself short if you skimp on parts. You're going to have problems - don't waste money on sales. That type of antenna, or the parts for it, may be on sale for reasons the sales clerks really don't want you to know.

If you're planning to put your system together properly, or you're having someone do it for you, take the time to ask questions. Annoy the heck out of sales people at the shop if you don't get answers. Never assume that what they do is correct for your needs. Ask other CB'ers if they've dealt with the shop - get their opinions.

If you find yourself putting up an antenna in your own mind, take the time to work it thru and then see how others did it. Compare notes.

Coax? It's part of the big three requirements for using a CB radio. Radio, antenna, coax - those make up the chain. A weak link in the chain, if you don't pay attention, can leave you frustrated.

Don't worry about coax length, don't concern yourself with it. Use quality parts - and pay attention to details with all aspects of the install. Location, mounting, power, and routing all can have an impact on your system.

If you have to buy coax, buy the stuff with the pre-molded and sealed ends, and use mounts that can take those types of

connectors and are able to be sealed from the environment.

If you want a DIY custom install, it's your responsibility now. If you don't pay attention to sealing, bolts, insulation and preventing water entry - bash yourself on this.

Location? If it looks cool there, are you really sure it will work there? Keep your options open. You're leaving yourself open for problems if you don't take the time to locate the antenna in a spot it needs in order to work properly.

Hint: No antenna will work like it claims if you don't install it like the manufacturer recommends. They can't guarantee their antenna will perform like they claim unless you put it together properly - and that means location too.

Questions? My box is open.

Thank you.
:+> Andy <+:

Hello JR: Yes my tuner is directly connected to the antenna.

I have a (another) remote tuner mounted to the ground plane radial bracket for a 20 meter Mastodon 5000 5/8 wavelength ground plane antenna, it tunes everywhere! Looks bitchen, 43 feet high! Works great on 12, 11, and 10.

I would say winning the shootouts first, kicking everybody's ass, then calling them juvenile. That's how its done.

You should slide on down to a shootout, its great to meet all the people, make friends, look at all the hardware, learn by seeing looking, and talking to all the shootout contestants. You may even become interested and want to but a Chevy Suburban, with 8 alternators, and 96 pill amp.

We could get ya a ball cap that says "JR Shootout Champ" and some half dressed honey hanging all over ya. You could sign autographs and charge each one a few beers for a technical lecher.

Ladder line transmission line, no not beyond my capability. I use it to wrap up all the sticks and weeds for the trash guy. Use it for speaker wire also. How do ya crimp a "F" connector on to that stuff?

Good question. Yes, skip does happen during the eclipse duration. I remember reading something on this during the last total eclipse a few years back. The AM MW band became active for the duration.

Sure enough 413.I do talk on the bowl once in a while,when the mood strikes me.I was in there thursday after I talked to twistedhed.I talked to Gravy Train in the wheat fields and another loud station out of Missouri.If conditions are right you'll hear me,I just can't compete when the real big dogs are on the hunt!I will stop in and call you're #'s .Do you have any specific times I'd be more likely to hook up with you?
Happy Holidays to you 413.

BTW Cute kid on you're site.You're son?

E-layer propogation can happen at anytime. The E-layer of the ionosphere is not as reliant on the solar event induced ionization. F-layer ionization generally has solar events that effect the level of ionization. Since the sun is being eclisped by the moon there is little chance that F-layer propogation will be enhanced. E-layer is less predictable, so who knows.

Andy I can agree different locations will give you different swr, but changing the length of coax will not correct the problem. Hell if i put up an antenna next to a steel shed this is a bad location and will result in a bad swr changing the length of coax doesnt make a lick of difference and won't change the swr In the past 2 weeks I have installed about 60 2.4 ghz antennas and the same number of 800mhz antenas on the same style vehicle, with the 2.4 we want the coax to be as short as possible just enough to make the connection since rg 58 is rather lossy at this frequency

Source record: 64002

I've got a friend who has been restoring his old 78 Bronco and would like to find the CB handset for the truck. It still has the amp/control box and plug in the dash, but somebody has taken his handset.

Do any of you have any connections or know of a place that might have this radio handset? I believe it should have all the channel changers, readout, volume control and the mic itself on the unit. If someone has a complete Ford unit that is this style then I'm sure he may be interested in that also.

Thanks,
Jeremy

"Toll Free" <tollfree@bigradios.com> wrote in message news:oid_5.131382
> No, what is funny is the fact that DaveMade pushes amps, and they have
> people that do, but seemingly forget about the guy who only buys one or
> two amps, and small ones.
==========
How could you say this when has dave ever pushed a amp on anyone he doesnt even sell them he doesnt care about the business If you knew anything you would know mr gunn is who owns and runs www.davemade.com he has the dm business at this point in time not dave, and if you really knew anything this is one of the main reasons x force started 3 years ago because dave had no desire to build amps so 123 split and you should know the rest

>
> Seems, if ya want to do business with the guys in DaveMade County USA,
> you have to have deep pockets.
==========
Untrue again , prove your lie many out there have bought many small amps from them

>
> And that, my friend, is bullshit.
==========
and so are you go back under your rock
>
> If they want to make people happy, provide customer service.>
==========
they must provide just enough customer service since i hear hundereds and hundreds of them across the band
>

> DaveMade and their cronies have been pushing that line of shit for so long

> Bottom line. For 3 years, I have heard the common every day driver asking
> questions and getting nothing in response... Especially since Dennis left
> the news-
> group (not Number 12, but Dennis at DM).
==========
davemades are not for the average guy they are not for ssber they are not for truckers, they are not for the rookie operator, can they use them there yes, but his business was all about competition thats his market you guys have made him out to be a supplier of everyone have any of you ever heard dave himself say anything post anything No i dont think he would
what is wrong with that

>
> XForce always seems helpful.
==========
yes they need to be they are /were a fledgling company getting there balls
broke about being a dave copy so they had to do something davemade didnt
which was talk to every tom dick and harry who wanted or was just curious
about an amp

>
> That means a LOT to the guys who are spending their hard earned cash on a
> small
> 2+4 or 6 pill.
==========
they are davemades major sellers the 3 pills and 5 pills and if they plunnk
down there hard earned cash it will be cheaper than a comparable amp on the
market

>
> It comes from Dennis and the rest, who are busy building amps and NOT
> providing answers to the questions.
==========
perhaps they have reasons for not answering every question posed to them
maybe some are a waste of time where as a davemade is not for them, maybe
they only want to deal with people they know or feel comfortable with,
remeber amplifiers are still illegal. you can run your business how you
want and i guess they do the same.

>
> Gee, X-Force has a good name, and a reputation for customer service.
> So, I guess, a manufacturer can provide both, huh?
==========
the good name came from daves design they provided the rest.

>

*However, no one has taken a stance regarding the issue around mobile
*antenna installs and problems with location. Very few have noticed
*what I've seen for years regarding this Coax Length issue.
*
*If it's in a bad location, you'll have SWR problems.
*
*If the mount isn't the right one, or poorly done, you'll have SWR
*problems.
***8

Andy

yes location of the antenna in a mobile installation does have an affect on the performance. The main single parameter that is affected is the ground loss. This affects the efficiency of the antenna as well as the feed impedance of the antenna. I have never denied that. I have stated and will always state that adjusting the coax length is not the proper way to address that problem. It is at best a last ditch effort to make the antenna work when nothing else will work. If the antenna is in a bad location, adjusting the coax length is not going to help the antenna radiate any better. It will just satisfy the transmitter.

****
*With the above two reasons, my experience has been to correct the
*problems by relocating the antenna. In virtually all of the installs

*I've worked on, this was the beneficial solution. Only in rare
*instances was the mount at fault and it's usually due to corrosion.
****

yes an mobile antenna should have as much metal under it at all possibilties.

****
*However, some people never budge on re-locating the antenna and so
*therefore the coax length issue comes up.
*
*In my own investigation of this, the coax length issue means the
*antenna is not resonate due to a number of factors. Most, if not all,
*are associated with the counterpoise, or the conductivity and reactive
*components the ground plane provides, or works against the antenna, at
*that particular location on the vehicle.
*
*Sure you can swap antennas, sometimes changing to a different loading
*scheme can work better at the location than others. But, are you
*willing to waste the time on that? Some do. However, some don't.
*
*On my pages, I suggest using a simple mag-mount so the new CB'er can
*see how the antenna will look on the vehicle. There's more to that,
*the installer [namely me] can also locate areas that are better to use
*the antenna at versus where the antennas owner wants to try it at.
*
*An MFJ-259 is a handy tool for working out the locations fine tuning,
*you can see how the antenna will work at the locations tried.
*
*So, why does an antenna work better at some locations on a vehicle
*than others?
****

the answer lies in the antenna construction and the vehicle type.

****
*Why does the SWR vary between locations on the vehicle? Ground? Metal
*panel not connected to the vehicle?
****

Mainly due to the construction of the vehicle. Different locations on a
particular vehicle will yield different ground losses. A given antenna has two
parts that make up the feed impednace. First is the grouond losses and the
second is the radiation resistance of the antenna. For a given antenna the
radiation resistance is dependant on the physical length and any load components
to electrically lengthen or shorten the antenna. Ground losses add in depending
on the type of antenna and it's location on the vehicle and height above ground.
Other losses that affect the overal feed point impednace is the presence of
other metal structures. For example, a trailer attached to a vehicle will alter
the feed impedance. Thus moving the antenna around on variuos spots on the
vehicle will affect SWR as the feedpoint impedance is altered mainly due ground
loss changes. The radiation resistance will vary some but only if large metal
objects, as explained above, are introduced into the mix.

****
*That is what piqued my interest. And my efforts to locate the
*information regarding this issue, seems to contradict what others
*firmly believe.
*
* There is a reason for why things are done the way they are
* by antenna manufacturers. To ensure the user a viable means
* to use the antenna in a wider range of locations and
* environment conditions without suffering severe/critical
* damage to a CB radio.
* The above, to me, is the most important advancement in the
* realm of antenna design and construction.
*
* They are thinking about us folks. We're important.
*
* I'm not talking about making it easier for us installers...
* nor are they trying to get us to buy coax by the truckload...
*
* Far from it.
*
* It's a liability. The antenna has to work in order to sell,
* it not going to make it in the real world if it fails.
*
*------> It's so the user can use the radio to get help.
*
****

manufacturers are more interested in getting your money. It is called capitalism. What ever gimmick they can create to make you buy their product over another is fair game. There are some laws about total fraud, but if they push the truth a little that is acceltable. Manufacturers play games with specs. They use term like typical. Thus they do not have to actually say what the minimum or maximum is, just what the typical performance is.

There is no liability in antenna sales. A couple of well placed words on the packaging and they are released from anyliability if the product does not work in all conditions. With suitable selected words, they don't even have to refund the cost of the product if it does not work. I think your blind faith in the manufacturers is very nice and works in the land of OZ, but Toto we are in Kansas.

****

**That, my friends, is the most important issue. If you have any
questions about that, see the subject line.
*
*This is what makes the NG so fun to be on.
*
*My best advice to the new CB'er, don't make it hard on yourself. Take
*the time to read, review, learn about those claims the antenna makers
*will say. You can't avoid it. It's not going away.
****

Better yet try and learn what the terms mean as to what the antenna makers are using on their advertisements. Reading specs and comparing them is worthless unless you understand what they mean.

****
*The best clues are the antenna placards that have the installation
*instructions with them that can be read without having to open the
*package. Compare those instructions with others of the peg-boards at
*the local CB shop. A lot of dust on the shelves? Complain! You may
*need to go elsewhere. The people there at the store may not want your
*business if they don't keep items moving thru the store. A dusty item
*is a dead product.
*
* Some will try to sell the antenna on the ease of tuning...
* Some will try to claim their antenna puts out more signal...
* Some will claim flexibility in mounting locations...
* Some will claim they've been in this biz for XXX centuries...
*
* All have valid points, but there is a difference, and it's
* within you to make the right decision. You have to put a
* system together, so choose carefully.
*
* One such point is guarantee, will the maker stand behind the
* product, or just leave you standing there? Read the fine
* print.
*
* Remember, the person that has to be made happy is you,
* no one else.
*
* Can't stand the sales pressure? Go elsewhere. A dealer may
* have the right to sell antennas. However, they don't have the
* right to shove it down your throat.
*
*If you are reading this message, then that means you have the ability
*to research. Take the time to read what those companies claim out here
*on the 'net. Their reputation is based upon their own knowledge base.
*If you're not getting the answers you need, look elsewhere. There are
*plenty of resources out here to help you.
*
*Don't ever settle on the first one you see, take time to look at your
*options. Then if it's the one you really want - then go for it. Buy
*what the antenna needs for installation.
*
*Don't settle for second rate, buy and use quality. You're selling
*yourself short if you skimp on parts. You're going to have problems -
*don't waste money on sales. That type of antenna, or the parts for it,
*may be on sale for reasons the sales clerks really don't want you to
*know.
*
*If you're planning to put your system together properly, or you're
*having someone do it for you, take the time to ask questions. Annoy

*the heck out of sales people at the shop if you don't get answers.
*Never assume that what they do is correct for your needs. Ask other
*CB'ers if they've dealt with the shop - get their opinions.
*
*If you find yourself putting up an antenna in your own mind, take the
*time to work it thru and then see how others did it. Compare notes.
*
*Coax? It's part of the big three requirements for using a CB radio.
*Radio, antenna, coax - those make up the chain. A weak link in the
*chain, if you don't pay attention, can leave you frustrated.
*
* Don't worry about coax length, don't concern yourself with
* it. Use quality parts - and pay attention to details with all
* aspects of the install. Location, mounting, power, and routing
* all can have an impact on your system.
*
* If you have to buy coax, buy the stuff with the pre-molded and
* sealed ends, and use mounts that can take those types of
* connectors and are able to be sealed from the environment.
*
* If you want a DIY custom install, it's your responsibility
* now. If you don't pay attention to sealing, bolts, insulation
* and preventing water entry - bash yourself on this.
*
* Location? If it looks cool there, are you really sure it will
* work there? Keep your options open. You're leaving yourself
* open for problems if you don't take the time to locate the
* antenna in a spot it needs in order to work properly.
*
* Hint: No antenna will work like it claims if you don't install
* it like the manufacturer recommends. They can't guarantee
* their antenna will perform like they claim unless you put
* it together properly - and that means location too.
****

Best yet make sure the manufacturer claims for mounting are practical. Remember that is a tatic that can divest them of any product responsibility. They can setup an antenna system on specific vehicle and get their claimed performance. IF you do not follow exactly as listed, then you deviated from the design criteria. They are no longer responsible for any performance degradation at the point.

*>
*> james
*
*I'll say. He sees a "conjugate impedance" looking into the coax.
*He has some sort of "conjugate equation" (I don't know what that
*was referring to).
*He gets a "conjugate matching scheme" with 18 feet of coax.
*
*Smith Charts are handy; a nice RF design software package is nicer.
*;-)
****

Snmith charts are nice for very quick and general ball park answers. If it can't
be done on a Smith Chart, mostly it can't be done in the RF world.

my friend you have been listening to the wrong sources. did you do
drugs when you were young and stupid? well i did. and i can tell you i
wish i hadn't. i am sure pres elect george wishes he hadn't also. but
what needs to be gleened from all this is this. what has been learned.
had gw learned from his mistakes. i think so. his life has not been
perfect. and neither had mine. clintonoski has never released his
medical records for public viewing. i believe we may never know what
all went on in the white house while he was pres. all i can say is that
i have read things and heard things. oh well he will be gone soon. and
the fumigation will begin soon. no more homos, no more smoking and
drugging, no more blow jobs from interns. oh can you smell what the
head is cookin? this is our house, you know. our house not his. our
house and for him to do these things there, well all i can say that it
is a disgrace, a disgrace. when a man such as the pres of the usa, can
without hesitation, cheat on his wife in the white house, then all i

can say, he is not trustworthy, and not wothy of the office he holds. he is after all cheating on us, isn't he???? this office, pres of the usa, is a special one. the most powerful man in the world. is it not one to be taken lightly. no sir, i am not a republican. but all i can say is that at this time they tend to lean in more of a direction that i want to take. you say you are a independent. maybe i am too. but i know what i want and am not ashamed to say it. these are perilous times we live in. we do not need a man holding the president's chair that has the judgement of a teenager. clintonoski has a terrible character flaw, actually he should never have been elected pres. but whatever. a good economy made the masses more forgiving. what can be said about americans. during the american revolutionary war only thirty percent of the people were in agreement to rebell against the british government. thirty percent. what price citizenship???????????? the dems tried to steal the last election, do you know that???? and you know what???? they failed at their own game. this was all planned . of course you know this????? you know the last time we had a similar situation was in 1960 with the nixon/kennedy election. kennedy stole the election. only
because nixon , for the good of the country , was willing to concede. so what happened? well how about vietnam. who knows what would have happened if kennedy had not been allowed to be pres. it was after all mcnamara's war. so for the loss of 58, 000 men, tell me, is it important who we elect as president???????? we must fight and now. no more giving in. no more 'getting along'. i understand 'them'. oh yes, i do. we must destroy them before they do the same to us. think about it jagget,.....cd is out.....

Just like a theorist. If their theory says the sky is yellow they will
argue such until they are blue in the face, even if you make them look
up in the sky and see it for themselves.

I suspect that your "theories" came from the web, because I haven't
seen any credible sources of information that support your claims, and
you seem unwilling to provide them as I have.

Easy. A standing wave creates a fixed point of high-voltage on the line. It is possible that the voltage at this point will exceed the maximum voltage rating of the radio's final. So the line is cut to a length where the radio is at the lowest voltage point on the standing wave, which is easy to do when the band is as narrow as the 11m band.

I have a handset that uses a 14-pin round connector, it goes to an
in-dash AM/FM/CB/8-track, but I think it is for a Nissan. I might be
similar.

news:91e1dc$9o5@dispatch.concentric.net...
> The FCC may have the right to inspect your equipment but that does not
give them
> the right to enter your home without your permission or a warrant.

...This is true... you have to give YOUR permission for them to enter and inspect your station. Refusal to allow inspection though (local LEO or no, search warrant or not), will in most cases earn you a fine or the threat of one if they beleive you are the source of the problem signal. ....Kinda' like refusing the breathalizer test in a DWI... you're presumed guilty (..and just like a DWI case where the driver refuses the test, the FCC will have their "observations", recordings, RF fingerprinting, etc...) If you decide to fight them in court over the fine (..and they have DEEP pockets for attorneys), they'll show up with plenty of 'evidence' whether they ever get into your station or not.

> they will usually show up with the local authority the second
> time with a warrant in hand. This is one of the reasons enforcement is so
> time consuming, costly and difficult.

Actually, the FCC needs no search warrant, and no judge's authority. The local LEO is usually there in case there's trouble.

> They will have to prove just cause to the judge in
> order to obtain the search warrant. The fact that you have an antenna on
> your roof should not suffice.

As noted above... they'll already have the 'evidence' before they come knocking. (or asking for a warrant)

>This Bill is a feel good bill and it will
> have little impact unless the Feds can tie some substantial dollars to it
> that will entice the locals to enforce it.

Here I agree totally.... another case of a law passed leaves it up to local authorities to pass laws that mirror the FCC's (says as much in the bill... you can't enact or enforce stricter rules than what they already have) and then leaves the responsibility for financial support of enforcement, prosecution, and possible liabilities squarely in the local authority's lap! Unless the FCC makes it ABUNDANTLY profitable to do THEIR job FOR them, I can't imagine very many Local Authorities getting involved.

Look, I'm not going to sit here and argue with you over this. Your misrepresentation of the facts gave the impression that I was a troublemaker going around posting in "in every group that could possibly be of interest to CBers," in some vague effort to harass CB'ers, which is simply not true. Instead, I have responded to existing threads posted in the ham radio newsgroups (I'm not responsible for where the thread was crossposted to before I joined the conversation).

It's like this discussion. Contrary to your claim that I'm "announcing the
passage of HR2346 with a big grin and wielding it like a club in every group that could possibly be of interest to CBers," I simply responded to a massage I read in rec.radio.amateur.misc. I didn't crosspost this discussion to rec.radio.cb (someone did that long before I joined this thread), and I'm not "announcing" anything, nor am I "wielding it like a club in every group that could be of interest to CBers." To suggest otherwise is a total misrepresentation of the facts (which is exactly what you did).

And again, I go back to what you originally said. You claimed that I was "announcing the passage of HR2346 with a big grin and wielding it like a club in every group that could possibly be of interest to CBers." Again, like I said before, that is a lie. I have only posted a handful of message since the passage of of HR-2346 (counting this discussion), and none of them announced "the passage of HR2346 with a big grin."

And, with that, I have nothing more to say about this. I didn't join this discussion so that I could get into an argument with you about my past posts. Instead, I offered detailed opinion about the enforcement efforts of the FCC (or lack thereof), and the issues surrounding

HR-2346. If you can't offer any ligitimate dispute about what I posted, then don't waste my time with trivia like this.

Hello C.L.P.: Great posts, this is what this ng is was ment for,
thrashing around these technical issues. And getting some place, in
other words learning something.

The comment/subject on "Common Mode Currents" needs to be discussed and
thrashed around here on the ng.

What are common mode currents, in a antenna installation?

How can they be detected?

How can they be removed?

I would love to hear this subject discussed. Maybe a new thread ah?
A lot of the guys on the ng group have a lot of good points, views,
comments, and replies. This is great!

More than likely, they will be taken to the fixer of their radios and he will be asked if they have any value. When the fixer finishes laughing and regains his breath, the pills will be removed for sale to someone who just cooked his finals and the rest consigned to duty as doorstops, anchors, and landfill. Help me spell junque.

Things have quieted down on Public Service freqs but there are power wars breaking out now and again as tropo causes the local Roscoe P Coltrain to escalate. I have personally seen 250 watt police rigs mounted on places where the entire jurisdiction could be seen line-of-sight and 5 or ten quite sufficient.

As a practical matter, the local gendarmes are not likely to use gear not type-accepted for no better reason than liability if something stupid should happen.

Given that the politzei are at various places on VHF/UHF/SHF spectrum these days, it is doubtful that the CB amp would work at all.

Kim, we've already discussed this. If you delete newsgroups in a crossposted thread, many of the participants in the discussion will not see your comments, since many are not in the newsgroups you don't delete.

In fact, in an existing thread with an ongoing discussion, it seems a little rude to join in that discussion and then exclude existing participants by deleting their newsgroups.

Of course, if there are a lot of newsgroups listed (especially newsgroups not at all related to the discussion, and where there are no existing participants), then that might warrant some newsgroup editing.

If before I was born, then twas before the late 60's decline initiation in education. As for the "National Honor Society", grats, since you had to be a better than average student to receive that....

Also, the comment was an amusement adder to the immediate thread it followed....not a comment as to perfection in your thread once removed---there has only been one perfect man on earth, and He was crucified.

Next, in a similarly close Florida congressional race in one of the "issue" counties, the Republicans had tried to count dimples just two years or so prior to this experience, and were roundly and rightfully sent home by the Democrats. Now, however, since the shoe was on the other foot no mention was made of this by the Dems (since they had flip-flopped?). Also I've been told it's possible to create dimples when stuffing 5 or 6 ballots in to punch at one time...the last one or two has torn hanging chads or is dimpled.....thus no way should hanging or dimpled ever be counted.....the voting methodology should be changed.....but despite the problem just prior (see above, two years or so past) the canvassing boards (Dems) saw no reason to change the ballot machines and thus lodged either no, or practically no protests depending on the county involved....I'm not saying there were illegal votes, but there is a possiblity of illegal votes having been created by the "stuffing" process.

I also have no illusions that votes are illegally created in elections.....the cemeteries vote in Louisiana and the nursing homes are emptied onto buses in New Orleans to vote....Louisiana legally allows an assistant to help someone vote....people vote even if they can't remember their own name. Remember it's not important that we vote....but vote responsibly according to one's own principles and beliefs....to vote without consideration of issues to just "go vote" is not responsible.

Movies do not stir my memory towards reality, as movies are not reality (i.e. not the real world, an imitation of reality). Movies, documentaries excluded of course, are entertainment and one should maintain the presence of mind to keep the two separate.

The new law states that the "Local Municipalities" are now allowed to create and enforce their own laws about or pertaining to CB radio.

Other than the comment I made above, the rest is open to interpretation, and will have to be muddled through in the courts.

not to change the subject but in the old days when i went to the shop ,
i would, from time to time see police officers buying foot warmers,
etc. there was a time when some police where into this stuff. heck
there used to be some of them that would drop the maul on you and of
course me being the nice guy that i am , i did my civic duty and
informed them that i wasn't paying them to talk on a cb radio. but that
was a long time ago, and i just had to reminisce,...head out.......

With all do respect, I am afraid that your knowledge exceeds your understanding. When one claims expertise in a subject, first some of the simplest things must be understood. You stated disagreement in a prior message that a shorted 1/4 wave length of coax is an infinite impedance, nor could changing the length of a transmission live vary impedance. Both of these are basic to understanding the more complex issues you choose to address. It appears that you ALWAYS assume that the antenna is 50 ohm with +/-J = 0. If this were true many of the things you say would apply, unfortunately such is not the case. Resonance, is defined as the condition where XL=XC with no resistive value specified. For example the resonance of free space is 377 ohms. You have narrowed the universe to a specific set of conditions which has no application in the real world. A million CBers have changed the length of their coax and observed the SWR change. Why?

"Coax Length Police" <anylength@willdo.com> wrote in message news:anylength-> Furthermore, the impedance required for an SWR of 1:1 is 50 + j0 ohms.
> Given that 50 + j0 ohms is resonant and it is a *requirement* for
> an SWR of 1:1, we can say

Well, kind of..... they may enact laws that mirror or reflect existing FCC regs.. they may NOT go beyond what's already on the books. The legislation includes no $$$ for enforcement, no $$$ (or waiver) for legal liabilities incurred or equipment required, and no $$$ for prosecution... the legislation also refuses to grant local authority any REAL regulatory or ultimate JURISDICTIONARY power.

A case of a Federal Beauracracy (with congress's help) sidestepping it's job if ever I saw one. Kind'a like the FBI telling the local cops "you can do our job for us, for free, incurring all liability, and even prosecute if you like.... but only if we (the FBI) can have final say on whether your 'busts' are valid". I seriously doubt many local authorities will be chomping at the bit to join this rodeo!

If the reflected power does not change, how is the transmission
line radiating power? Where is the power coming from?
You say power is radiated from the line but power along the line
is constant. Explain that.

> ...a perfect coaxial transmission line will contain all the RF within the
> shield. This is assuming that the impedance of the power transmitted
> through the line is equal to that of the line.

How can "power tranmitted through the line" not have the impedance
of the line?

>
> Sparky, FLRC

Speaking of using a meter, look what you wrote earlier. I was
speaking of using an SWR meter. And, as I suggested, you were
speaking of using a voltmeter. A voltmeter will show standing
waves which change along the line. An SWR meter will show the
Standing Wave Ratio which is constant -- just as I said.

Yes, Guys,

Please listen to these two!! You'll save yourselves a lot of grief as well as a lot of useless labor. It really boils down to this: if you are "tuning" your antenna or chasing resonance/matching by cutting coax, you are masking the real problem and "fooling" your test equipment as well as yourself. If you will do just what Handy Andy and PP have just written, you will have a correct and properly performing antenna instal-lation.

Without trying to be a smart aleck or flaming anybody, I wish to present the following antenna installation for your perusal.

I operate a motor driven all band ham antenna`mounted via a ball mount directly on the left fender of the car. Pressing a switch at the opera-ting position causes the loading coil to move up or down within a hollow tube. The coil is surrounded at the top of this tube by "fingerstock" which are springy little contacts. As the coil is moved up/down within these fingers, ANY frequency between 3.6 and 30 MHZ can be operated with a 50 ohm match and 1:1 SWR (usually, but never more that 1:4). Using the assertion that coax must be 18 feet @ 27 MHZ, at 3.6 MHZ I "must" have almost 130 feet, right? At 7.2 MHZ (40 meters), I'd have to have around 65 feet, right. At 20 meters, around 30 feet,------and so on in ever decreasing lengths as frequency increased. So, I'd have to have 10, or 12, or ??? different lengths of coax in my vehicle. Where in the world would I put all the extra coax in a small station wagon? Er, uh, we have another problem. Since the antenna tunes infinitely to ANY frequency AND continuously, having enough "lengths" of coax to operate all these frequencies is impossible! So, what DO I use? One foot to a 12V changeover relay (I'll explain its purpose in a minute), 9" to an amp, about 6" to the radio. All of these components are mount-within 2 feet of the antenna in the rear of the car! Bu..bu..bu.but, that can't WORK! Ya gotta figure all those various current nodes, and "correct" coax lengths to nullify various anomalies along its length, right? BULLSH**! OK! OK! I'm jerkin' yer chain a little here.
How do I *know* the system works without all the coax length hooey? That 12V relay switches out the amp and radio and connects the antenna direct ly to an MFJ 259 Analyzer on the dash. By setting the frequency I want to operate on the 259, and operating the antenna motor to place the antenna into resonance (for practical use, let's separate matching and resonance into two different catagories), I simply observe the meters on the 259 until I get the lowest SWR and approximately a 50 ohm match, which doesn't *have* to be exactly 50 ohms. Then I switch back to the radio and start talking. I have also a field strength meter on the dash that lets me make comparisons or fine tune for max output. But I have

found that my tuning method nets me max performance anyway--which tells me I have the best performance possible from a multiband system.

Again, according to the coax length gurus, my system *CAN'T* work because I don't have "certain" lengths of coax for each frequency I work including 11 meters. Yet, it works well, allows me to talk anywhere I can hear, and is as efficient as any mobile system around. That's no brag--it just comes from 35 years of training and experience.

What I want, and the reason I wrote this, is for the coax length guys to explain WHY/HOW this multi band system works with 4 short jumpers, NONE of which are over 12" long. IF one *must* have 18' of coax at 27 MHZ, then one *must* have 130' at 3.6 MHZ, right? BTW, another reason, is to get away from the stupid "illegal this, illegal that" stuff! Think of it as a puzzle and a legitimate discussion of radio which this board is really for.

Best 73

Jerry

If you don't believe the theory, how can you quote any books?

I'm still not convinced that you actually quoted the book since
you said you "summarized" it and now you refuse to quote the
sections verbatim.

I will get the book this week from my work library.

> >This nonsense that a coax radiates with the presence of standing

> argue such until they are blue in the face, even if you make them look
> up in the sky and see it for themselves.

But the theory says the sky is blue. It is caused by Rayleigh
scattering. Care to "summarize" a book that states differently?

> I suspect that your "theories" came from the web, because I haven't
> seen any credible sources of information that support your claims, and
> you seem unwilling to provide them as I have.
>
> Sparky, FLRC

Well no one actually wrote that a coax does not radiate because it
is common knowledge. It would be stating the obvious.

I believe you have either mis-"summarized" or used text that is
entirely out of context.

I'll get your book. We'll settle this.

yeah and what happened to it ? it proved over time not to work to
well.otherwise it would be used.
what is the big deal with the input anyhow if it did have a bad swr all you
would need to do is drive it with more watts , the watts would still end up
the same on output

While you are correct that FCC agents cannot come into your house without permission, they have the right to inspect your equipment. Now if they are allowed into your home, they may NOT "search" for anything, i.e. rifle thru drawers, examine personal papers, etc. But when one obtains a license or operates a CB radio, he gives "tacit" approval for FCC to inspect their radio station. When/If an FCC agent comes to your door, he already has a pretty good idea that *you* are the source of whatever difficulty at hand. Their equipment is very good. If the agents are not allowed to inspect the station at the time of the "offense", then it gives the "offender" a chance to get rid of the amp, modded ham radio, etc, that drew FCC's attention. So, if you refuse the "surprise" inspection, this is a case where you will still get some sort of citation, fine, or whatever. To refuse inspection is a violation in and of itself, so ya just can't win, eh?

The Wilson and Firestik links are essentially duplicates. They
were either written by the same person or plagiarized.

Furthermore, the last link doesn't agree with the first three.
It says to use coax with a length that is a multiple of 3'.

What's the dillio? You can't even get these sites that perpetuate
myths and old wives' tales to agree.

Above and beyond that, the second link refers to cophased antennas
as well as single antennas. In that case, a fixed coax length is
required to provide the necessary quarter wave matching transformer.

By the way, NONE of those links explain why you need 18' AS YOU CLAIMED.

Actually the intrinsdic impedance of free spaace is 377 Ohms. Impedance has
nothing to do with resonance. Impadance is nothing but a complex number.

50 Ohms impedance can be an infinte combinations of R and X. There is an
infinite solutions for 50 Ohms.

transmission lines less than a quarter wave are often used for lumped constants.
Thus the transmission line can be either a capacitor or an inductor depending if
it is shorted or open at one end.

I totally agree, changing the length of coax, particularly on a mobile installation, which is how this thread started, introduces various values of XL or XC which in combination with the antenna lets a radio see 50 ohms.

No 1/4 mobile antenna is 50 ohms. A perfect 1/4 wave over perfect ground is 25 ohms and it increases from there do to losses. By moving the antenna from resonance and introducing some reactance we can make it look like 50 ohms.

From: Pete <pete@keirle.fsnet.co.uk>
Message-ID: <91ghlhmao2@news6.svr.pol.co.uk>
Source record: 64147

Hello readers,

Can you help me with any information on the ICS Electronics Ltd. All-Mode Terminal Unit?
I purchased this at a rally in Deven and all I can tell you is that it decodes the following modes...

CMD
ARQ
FEC
RTTY
CW
ASCII

The front panel has a LED segment tuning display, Wide/Narrow + Nor/Rev switching and a
cluster of status LED's on the right-hand side.
The rear panel has two 5-pin DIN sockets marked 'Terminal' and 'Xcvr', three presets for audio
In/Out and PTT and a DC supply socket.

The unit is made by ICL, Arundel, W.Susssex.

My unit was bought "as seen" and is not working. I would appreciate any info. at all. Perhaps
you have some idea of the pin designations for the two DIN sockets..?

Well, thanks for reading this and thanks in anticipation for any possible info.

73's and best regards...
Pete.

And where in this did I say I was operating outside the 40 CB band? I read it twice and I didn't see any where that I was outside the CB band. And where did I say I was even keying up with an amp? Just stated that I had some. And where did I say my stuff was modified? Didn't say that either! Didn't say I was using them did I! Get your facts straight before ya say anything nextime!! Oh well, Untill next time.....

<snip>

This is exactly the point that I have been trying to make all along.
Changing the length of the coax does not reduce or eliminate reflected
power, and therefore standing waves. This can only be done by properly
tuning your antenna. But for the person that doesn't want to build an
L- or Pi-network, you can cut the coax to reduce the harmful effects
of standing waves on your radio at the expense of radiated power. A
poor substitute, IMO.

Here's a joke for you: A guy picks up a tipsy babe in a bar. They go to her place, and to warm things up, he starts to go down on her. He's eating away, when suddenly out pops a little piece of carrot. "Hmm," he thinks, spitting it out, and then he continues to lick her. A few moments later, out comes a sliver of celery. "This is weird," he thinks to himself. Once again, down he goes. This time, out pops a small piece of balogna. This is too much for the guy. He looks up at her and says, "What's the matter? Are you sick or something?"
"No," she says, "but the guy before you was!"

Trust me, this is no place to argue coax length. Whatever people want to believe is fine - it won't hurt them. You will talk till you're blue in the face, but some people here have their minds made up. They believe it so blindly they won't hear real discussion.

Handy Andy believes you can "conjugate match" with the right length of 50 Ohm coax! Holy smokes!

Bob.

Hey, Scott!

I'm not as far along as you, but my '87 Chevy Celebrity, which I bought new, has 198,387 miles on it. Engine and tranny have NEVER been opened except for routine service--it is all original except for the usual repair stuff like brakes, belts, alternators (3 in 13 years) and one CV axle last summer. It starts, runs without any ticks, clicks, unusual noises, or smoke. I have kept it for my "radio" car. Since 1973 when I said a very angry goodbye to Ford, I've driven nothing but GM since. I get excellent service, economy and reliability from Chevrolet. With the troubles I had with Fords, INCLUDING lots of trouble getting rid of ignition noise, you couldn't RUN fast enough to give me one! LOL! I also have a 1993 Lumina Z34 coupe with 70,000 miles and it gives no trouble, either. It is my "pampered" car that only gets driven on sunny days and to church on Sunday. I wouldn't trade either, or both, plus boot for one NEW Ford!

Chevy Forever!!

You raise another point. The locals do not have the equipment to develop a case. They would have to rely on the FCC to provide and operate the equipment so there would be enough evidence to stand up to a trial. A recording of your radio bleeding over someone's TV does not mean you are running illegal equipment.

This is where they have control over the Hams. If a ham refuses his ticket gets pulled there is no eminent penalty to a CB operator unless they FCC has gone to the time and expense to monitor you and then fine you.

For any one who wants to know exactly how it whent down in congress and what was said, here it is.

KRS

--
Congressional Record article 2 of 23

AUTHORIZING ENFORCEMENT OF REGULATIONS ON CITIZENS BAND RADIO EQUIPMENT
(House of Representatives - September 27, 2000)

[Page: H8275] GPO's PDF
Mr. BURR of North Carolina. Mr. Speaker, I move to suspend the rules and pass the bill (H.R. 2346) to authorize the enforcement by State and local governments of certain Federal Communications Commission regulations regarding use of citizens band radio equipment.

The Clerk read as follows:

H.R. 2346

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,
SECTION 1. ENFORCEMENT OF REGULATIONS REGARDING CITIZENS BAND RADIO EQUIPMENT.
Section 302 of the Communications Act of 1934 (47 U.S.C. 302a) is amended by adding at the end the following:
`(f)(1) Except as provided in paragraph (2), a State or local government may enact a statute or ordinance that prohibits a violation of the following regulations of the Commission under this section:

`(A) A regulation that prohibits a use of citizens band radio equipment not authorized by the Commission.

`(B) A regulation that prohibits the unauthorized operation of citizens band radio equipment on a frequency between 24 MHz and 35 MHz.
`(2) A station that is licensed by the Commission pursuant to section 301 in any radio service for the operation at issue shall not be subject to action by a State or local government under this subsection. A State or local government statute or ordinance enacted for purposes of this subsection shall identify the exemption available under this paragraph.
`(3) The Commission shall provide technical guidance to State and local governments regarding the detection and determination of violations of the regulations specified in paragraph (1).
`(4)(A) In addition to any other remedy authorized by law, a person affected

by the decision of a State or local government enforcing a statute or ordinance under paragraph (1) may submit to the Commission an appeal of the decision on the grounds that the State or local government, as the case may be, enacted a statute or ordinance outside the authority provided in this subsection.
`(B) A person shall submit an appeal on a decision of a State or local government to the Commission under this paragraph, if at all, not later than 30 days after the date on which the decision by the State or local government becomes final, but prior to seeking judicial review of such decision.
`(C) The Commission shall make a determination on an appeal submitted under subparagraph (B) not later than 180 days after its submittal.
`(D) If the Commission determines under subparagraph (C) that a State or local government has acted outside its authority in enforcing a statute or ordinance, the Commission shall preempt the decision enforcing the statute or ordinance.
`(5) The enforcement of statute or ordinance that prohibits a violation of a regulation by a State or local government under paragraph (1) in a particular case shall not preclude the Commission from enforcing the regulation in that case concurrently.
`(6) Nothing in this subsection shall be construed to diminish or otherwise affect the jurisdiction of the Commission under this section over devices capable of interfering with radio communications.
`(7) The enforcement of a statute or ordinance by a State or local government under paragraph (1) with regard to citizens band radio equipment on board a `commercial motor vehicle', as defined in section 31101 of title 49, United States Code, shall require probable cause to find that the commercial motor vehicle or the individual operating the vehicle is in violation of the regulations described in paragraph (1). Probable cause shall be defined in accordance with the technical guidance provided by the Commission under paragraph (3).'.

The SPEAKER pro tempore. Pursuant to the rule, the gentleman from North Carolina (Mr. Burr) and the gentleman from Massachusetts (Mr. Markey) each will control 20 minutes.

The Chair recognizes the gentleman from North Carolina (Mr. Burr).

GENERAL LEAVE
Mr. BURR of North Carolina. Mr. Speaker, I ask unanimous consent that all Members may have 5 legislative days within which to revise and extend their remarks and include extraneous material on H.R. 2346 .

The SPEAKER pro tempore. Is there objection to the request of the gentleman from North Carolina?

There was no objection.

Mr. BURR of North Carolina. Mr. Speaker, I yield myself such time as I may consume.

Mr. Speaker, I support H.R. 2346 . It is an important initiative to improve compliance with FCC rules governing citizens band radio service.

Citizens band radio service can serve some very important functions. For instance, many people use CB radios in order to communicate in times of emergency. America's trucking community uses CB radios to report accidents and traffic problems on our Nation's highways and roadways. Many other people use CBs for simply short-distance communications, and others use it as a source of entertainment.

These constructive uses, however, are being overshadowed by the practice of a few bad actors. A number of individuals have taken advantage of the unlicensed nature of CB radio to operate outside the boundaries of FCC rules. In particular, a recurrent problem is CB users boosting their signal strength with power amplifiers. Further, some CB users operate outside the permit frequencies allocated for CB radio service.

When these violations occur, unexpected and potentially harmful interference can result for others who use the service. Traditionally, Congress has looked to the FCC to enforce its rules. In fact, current communications statutes give the FCC great authority to enforce its rules and take remedial action when the rules are not followed.

Unfortunately, the FCC has made clear that reported violations regarding CB radios will be investigated only as time, manpower and priorities permit. The FCC has also indicated that it will only investigate CB violations where there is convincing evidence that results from a violation of the rules has occurred, and then only on a low-priority basis.

H.R. 2346 is an effort to provide a back-up enforcement mechanism. Under H.R. 2346 , a State or local government is given authority to enact a statute or ordinance requiring operators of CB radio service within their jurisdiction to obey FCC rules. Violators would be subject to enforcement by State or local government.

The bill is carefully drafted so as not to interfere with the FCC's enforcement authority and provides suspected offenders with an appeals process.

This noncontroversial bill was reported from the Committee on Commerce by voice vote and enjoys bipartisan support.

I commend the gentleman from Michigan (Mr. Ehlers) for his work on this bill, and ask all Members to support its passage.

Mr. Speaker, I reserve the balance of my time.

[Page: H8276] GPO's PDF
Mr. MARKEY. Mr. Speaker, I yield myself such time as I may consume.

Mr. Speaker, the gentleman from Michigan (Mr. Ehlers) and the gentleman from Michigan (Mr. Dingell) from Michigan have spent a considerable amount of time dealing with an issue which I think should be of great concern to everyone because of the increase in its occurrence as a phenomenon.

We have millions of CB operators across the country. They have a lot of fun with it, and they do not really cause anybody any problems at all. They are kind of like the original Internet, in a lot of ways. They are out there with their own separate sets of networks on which they are able to communicate, and it is really a great thing for our country.

[TIME: 1315]

But there has been a rising incidence of individuals using CB frequencies abusively. They actually build towers in their neighborhoods, and they start broadcasting over the CB frequency.

It has several severe adverse consequences for all of the rest of the people who live in the neighborhood. It has the effect of interfering with television broadcast reception. It has the impact of interfering with telephone reception. It has the impact of interfering with every electronic piece of equipment in the home.

Moreover, it has even more consequences. That is, the content of many of these CB frequency broadcasters is profane, and it interferes with the ability of families to be able to live in peace and quiet without having someone in the neighborhood broadcasting in a way that actually goes into the homes of others who live in that community.

The Federal Communications Commission does not have the resources to be able to deal with this essentially local phenomenon, this set of brush fires that are cropping up increasingly across the country in community after community.

What this legislation does is to give to the States the ability to move in and to enforce the laws which ensure that these neighborhood nightmares, these nuisances are shut down, and that those individuals use the CB frequency in the same way that the millions of others in America who use the CB frequency use it, that is, for their own enjoyment and not in a way which creates a nuisance for everyone else in their community.

Mr. Speaker, the gentleman from Michigan (Mr. Ehlers) and the gentleman from Michigan (Mr. Dingell), in my opinion, have done an excellent job on this legislation. I thank the gentleman from North Carolina (Mr. Burr) for bringing it out to the floor at this time.

Mr. Speaker, I reserve the balance of my time.

Mr. BURR of North Carolina. Mr. Speaker, I yield such time as he may consume to the gentleman from Michigan (Mr. Ehlers), the bill's author.

Mr. EHLERS. Mr. Speaker, I thank the gentleman from North Carolina (Mr. Burr) for yielding me this time.

Mr. Speaker, I rise in support of the legislation that is before us which will combat unlawful use of citizen band radios. First of all, I want to thank the gentleman from Virginia (Chairman Bliley), the gentleman from Louisiana (Mr. Tauzin), the gentleman from Michigan (Mr. Dingell), and the gentleman from Massachusetts (Mr. Markey) for their assistance in bringing this legislation to the floor. I also thank the gentleman from North

Carolina (Mr. Burr) for his active efforts here.

Mr. Speaker, I appreciate the time that they all have taken to address this problem and pass it through the Committee on Commerce.

This legislation is not only important to my district, but to many other cities that are dealing with the same problems that this bill addresses. For several years, many of my constituents have been fighting a losing battle against illegal CB radio operators. Most CB radio operators use their equipment within the low-power levels prescribed by the FCC rules and regulations and do not cause any problems. However, some users illegally boost the range of their home-based CB equipment by using high-powered external linear amplifiers. Also, occasionally, they modify the frequencies illegally.

When the CB level is amplified above legal levels, or the frequency is changed, it causes interference with television, radio and phone signals and damages other electronic equipment in the surrounding houses. The interference can be so bad that surrounding residents hear CB conversations over their televisions, radios, and phones. This can be extremely frustrating as telephone conversations can be cut off, television signals can be distorted, and other electronic equipment can suffer interference.

Sometimes it is so bad that neighbors have to suffer through profane and abusive language that is being picked up by their own television sets, radios, or telephones.

This is not an isolated problem. Most of the cosponsors of this legislation have exactly the same problems in their districts, and that is true of many other areas of the country as well.

The Federal Communications Commission (the FCC), knows about the problem and has outlawed the sale and the use of these amplifiers. However, they are still on sale for other purposes and can be easily modified for use with CB radios. Even worse, the FCC does not have the personnel to enforce the law. Localities are powerless to help, because the FCC has a total preemption over enforcing regulations regarding CB radio use.

The legislation before us will allow State and local authorities to enforce the FCC regulations regarding CB equipment and frequencies. This would be a narrow exemption from the total Federal preemption of CB radio regulation enforcement and would give residents recourse against an unlawful CB operator by capitalizing on the enforcement capabilities of local government and on the FCC's years of experience in setting rules governing CB use. In other words, the best of both worlds.

The intent of this provision is to allow State and local governments to pass ordinances that will mimic Federal law and allow for its enforcement.

Mr. Speaker, this legislation, let me emphasize, does not change what equipment is and is not legal. People who are operating CB equipment in accordance with the FCC rules will not be affected at all by this legislation. I have also worked with the ham radio operators (amateur radio

operators) on this provision to ensure that their concerns about this legislation were addressed. Frankly, the ham radio operators in my district are very pleased with the bill. They were the ones who initiated it by asking me to address this particular problem, because it affected them as well.

The bill also contains a provision that exempts anyone who possesses a ham radio license from this legislation.

Lastly, the legislation contains a provision that specifically restates that local law enforcement officials must have just cause to investigate whether or not someone is operating an illegal amplifier before they take action against someone.

Just to summarize in a nutshell, we have a real Catch-22 at the moment. The Federal Government has the power to enforce these laws. Not only that, we preempt the law from other communities so that they cannot enforce them. And yet the Federal Government, through the FCC, does not enforce them. So we tell people we will enforce it, but we cannot enforce it. This bill resolves that problem by allowing those on the scene, the local law enforcement agencies, to deal with the problem that the Federal Government has preempted but does not enforce. I believe that this will be beneficial to everyone.

Mr. Speaker, in closing, I urge the House to approve this legislation. It is supported by the Committee on Commerce, the FCC, and local law enforcement officials. Again, I thank the leaders of the Committee on Commerce for bringing this bill to the floor.

Mr. MARKEY. Mr. Speaker, I do not have any other requests to speak at this time; and with the request to all Members to support this good piece of legislation, I yield back the balance of my time.

Mr. BURR of North Carolina. Mr. Speaker, I thank the gentleman from Massachusetts (Mr. Markey). Again, I thank the gentleman from Michigan (Mr. Dingell) and the gentleman from Michigan (Mr. Ehlers), the authors of this bill. I have no additional speakers, and I yield back the balance of my time.

The SPEAKER pro tempore (Mr. Walden of Oregon). The question is on the motion offered by the gentleman from North Carolina (Mr. Burr) that the House suspend the rules and pass the bill, H.R. 2346 .

The question was taken; and (two-thirds having voted in favor thereof) the rules were suspended and the bill was passed.

A motion to reconsider was laid on the table.

They (feds) would also have to provide the proper equipment and training to allow the locals to substantiate a wrong doing that would hold up in court. My guess is there will be some examples set, especially in the areas whose representative penned this bill. However, in the big picture it will be fart in a tornado. Except for those poor Bubba's that insists on talking over his neighbors TV's and don't head the warning signs.

If you read the following sentences I believe this will sum it all up for CBers who want to know what they have to do in order to continue with operations as normal and not have to worry local authorities invading there privacy.

Remember, a Ham can talk on 11 meters but a CBer can talk on Amateur frequencies. Go down a take the test, "be exempt"(notice I didn't say legal), and who knows you may even enjoy the benefits Amateur service provides.

KRS

The bill also contains a provision that exempts anyone who possesses a ham radio license from this legislation.

Lastly, the legislation contains a provision that specifically restates that local law enforcement officials must have just cause to investigate whether or not someone is operating an illegal amplifier before they take action against someone.

I had 18 feet of coax in my Jeep. I cut it down to 7 feet so I wouldn't have a coil of leftover coax to get in the way. I, nor anybody else noticed a lick of difference. I use a KW-7 on the bumper that I've never tuned. I have about a 1.2:1 SWR. Coax length DOES NOT matter. Using good coax makes more difference then length. IMO, RG-58 sucks!

Stolen from another newsgroup:

THE GREAT POLICE OFFICER

Well, Mr. Citizen, it seems you've figured me out. I seem to fit neatly into the category where you've placed me.

I'm stereotyped, standardized, characterized, classified, grouped, and always typical. Unfortunately, the reverse is true . . . I can never figure you out.

From birth you teach your children that I'm the bogeyman, then you're shocked when they identify with my traditional enemy . . . the criminal!

You accuse me of coddling criminals . . . until I catch your kids doing wrong.

You may take an hour for lunch and several coffee breaks each day, but point me out as a loafer for having one cup. You pride yourself on your manners, but think nothing of disrupting my meals with your troubles.

You raise hell with the guy who cuts you off in traffic, but let me catch you doing the same thing and I'm picking on you. You know all the traffic laws . . . but you've never gotten a single ticket you deserve.

You shout "foul" if you observe me driving fast to a call, but raise the roof if I take more than ten seconds to respond to your complaint.

You call it part of my job if someone strikes me, but call it police brutality if I strike back. You wouldn't think of telling your dentist how to pull a tooth or your doctor how to take out an appendix, yet your always willing give me pointers on the law.

You talk to me in a manner that would get you a bloody nose from anyone else, but expect me to take it without batting an eye.

You yell something's got to be done to fight crime, but you can't be bothered to get involved.

You have no use for me at all, but of course it's OK if I change a flat for your wife, deliver your child in the back of the patrol car, or perhaps save your son's life with mouth to mouth breathing, or work many hours overtime looking for your lost daughter.

So, Mr. Citizen, you can stand there on your soapbox and rant and rave about the way I do my work, calling me every name in the book, but never stop to think that your property, family, or maybe even your life depends on me or one of my buddies.

Yes, Mr. Citizen, it's me . . . the lousy cop!

The author of this article was Trooper Mitchell Brown of the Virginia State Police. He was killed in the line of duty two months after writing the article.

Dick Carroll wrote:
>
> First you've gotta write something worthy
> of debate instead of drivel.

So you're saying that a person has no right to discuss an issue in this newsgroup if they lack proper qualifications? Or the enforcement problem in the citizens band is not the result of many years of failed FCC enforcement? Or that budget restraints were not used as an excuse? Or that some in the FCC are not now seeking more money to expand the enforcement division? Or that people do want to see a greatly expanded enforcement agency in Washington? Or that the 20, or so, existing enforcement personnel can control the estimated 25 million CB'ers? Or that the FCC would not have to hire hundreds of new enforcement agents? Or that this legislation is not a possible solution to the problem?

All of those points were raised in my message, and more. Now, if you can't find something worthy in all that, either you have no defense for your position at all or you want to avoid debate entirely so the existing lack of enforcement in the citizens band is not challenged. I strongly suspect the latter is the real reason behind the attempts by many CB'ers to avoid debate. So what is your reason, Dick?

Jeffrey Herman wrote:
>
> JR, I would place more credibility in
> Phil Kane's comment since he's a
> former FCC attorney.

Look, I don't want to keep trashing Phil, but when he first started talking about this legislation a few months ago, he didn't even know who sponsored the bill. He was ranting about some congressman who proposed similar legislation several years ago and was not even involved with this legislation.

He also fails to note that FCC policy has changed greatly since he left the FCC. For one thing, the FCC was directly involved in the creation of this legislation, and appears to fully support it.

And finally, he keep talking about some jurisdictional issue that simply does not exist. If it did exist, it would have been addressed by lawyers at the FCC, the House, the Senate, or the White House, long ago.

Now, I have no problem if Phil wants to oppose this legislation on a personal level (everyone has a right to do that). But, when he passes himself off as an expert on this legislation, or on constitutional issues (jurisdiction), I have to point out that the evidence simply does not support that. The bill itself mentions the sponsors, the congessional record clearly mentions FCC involvement in this legislation, and there is no evidence whatsoever of a jurisdiction issue.

I recall being pilloried for suggesting that this might cause a run on
Codeless Tech licenses :-)

The just cause or probable cause you suggest is not a whole hell of a lot
let it be said. When the local court decides what it will accept as
'expert' testimony, what sort of mediation drill they may wish to use
(like the local amateur club), and lay in a stock of the RFI papers from
Cousin Charlie to duck the issue entirely where possible, the PC is likely
to be the radio fixer for the police department, a receiver or freq
counter, and a R/S field strength meter.

Might it just be simpler to give up Antique Modulation?? Couldn't resist
:-).

Maybe the entire matter was poorly conceived to intentionally cause a run on codeless techs, therefore it would be inevitable some of those taking the test would leave cb and then become "exempt", by being a hammie, and a side effect, also maybe intended, would be alleviation of some of the traffic from 11 meter.

Well, I wasn't referring to the local enforcment thing. I believe, if
I read it right, the original poster asked if the FCC agents must have a
warrant to enter the property. Since they aren't there to "search" your
house and only to inspect the station, the laws apply to ANY civilian
radio station including a CB station. The simple fact is, that if ANY
operator is visited and refuses to allow the inspection, he will have
already violated the regulation that requires the inspection be allowed.
You *can* refuse entry, but in so doing, you are already inviolation of
that particular portion of the regulations.

I understand. I mentioned the 'legal CB' messageboard just so everyone would know that certain knuckleheads would go into those newsgroups and make themselves a general pain 3 feet below the neck. If one tries to make a disclaimer or comment as to the group is for discussing legal operations only, certain individuals seem driven to post there even more than on boards that state they do not care how folks operate. This suggests to me that these aforementioned individuals are not there trying to force their opinions on others, they are there for one reason only. That reason is to flame as many folks as they can. Unfortunately, there is no sanity test given for people to access the internet.

Dont listen to him, it was his own un confirmed annowncment.
He will do anything for attention, that results in ratings.
Asshole also pays his production people and interns peanuts

hmmm, so what you are saying is that if i am out in the county park somwhere, talking skip, and a constable pulls up and ask to see my equipment, etc. and i pull out my no code license ,....that's it????????, how do they know its a real license? i think there are many things that must fall together before this thing takes hold and around here, well i really don't think they are going to worry about it too much anymore. heck there are not a lot of big stations operating around here anymore and the ones that do are run by men in their fifties who have been doing it for a long time , and even they don't operate that much anymore and less and less as time goes by. there is no ground swell of kids getting into the hobby. and so therefore, i predict that the majority of action will go against truck drivers operating foot warmers. think about it, they are there, they are already stopping them for spitting on the sidewalk around here, why not add a fine for illegal radio equipment. because otherwise, there will slim pickens in this department , at least around here, ...cd is out..

Thats probably even a better one than I came up with CD. The whole damn thing was intended to screw with the truckers. Yea, why not? Easy pickins, shooting ducks in a barrel, and they won't desroy the stuff, they'll auction it off, tag it with a homing device, or at the least an invisible-to-the-eye mark and pop different drivers over and over with the same box. Or maybe there exists a subterfuge plot to get all truckers hammie licenses.

They may need a warrant to ENTER your home against your will (in which case
you can bet there'll be a LEO standing beside the agent), but a visual
inspection of your station is NOT neccessary or even usual for the FCC to
levy a fine. They will ASK politely once... if DENIED entry, they may not
even bother to seek a warrant and instead issue the fine or seek a
judgement.... like I said, by the time they arrive at your doorstep, they've
already gathered all the evidence they need to make thier case in court if
neccessary. IN SHORT... they don't need to enter your home to 'prove
anything'.... refusing them entry in all likelyhood will get you exactly
what you're trying to avoid... the fine.

> They (feds) would also have to provide the proper equipment and training
to
> allow the locals to substantiate a wrong doing that would hold up in
court.

Nothing in the legislation spels that out, although I'd assume they'll offer
some sort of handy-dandy 'guide-book' for the Local LEOs (perhaps... "RF
Policework for Dummies").

I'd agree..... It might cause a few problems for some of the "high-profile"
players.

Wellll...

In the moon's shadow, the degree of ionization should be different from surrounding areas that are illuminated. The gradient between the areas should do *something* unusual to radio signal refraction, but as a nearly total ignoramus on the subject, I am not in a position to say what that something might be.

Any rocket scientist out there care to alleviate my abysmal ignorance? ;-))

Thanks,

Roger, N2NHY

For all the ham spammers like the n8w kid...
Since someone mentioned Howard Stern I thought I would add this....

HOWARD STERN HAS A DAVEMADE AMP AND TALKS ON THE CB RADIO.
How do I know????
Because he is an aquaintance of mine and purchased the amp from a friend of mine!
He also used to live quite close to me but, since the divorce lives in Manhattan now!

I also agree. Just leave these people alone. They enjoy whatever they do with radio. "To each his own" is what I like to say. I started my radio hobby with the CB band. I never would have discovered amateur radio without that. Yea, I used bootleg equipment from time to time, but if that is what you operate, more power to YA. Enjoy the hobby. As for Mr. Doug Adair, buzz off buddy.

>warrant..

Not a consent search.. or a search incident to apprehension.. or a pat down search.. or a search for everyone's safety.. there are quite a number of searches that don't need a warrant.. but, as has already been stated - the FCC and local police will not get a search warrant - they aren't searching for anything - they don't go in your closets and under your bed - you invite them in to inspect your equipment - just don't let the cop fool you into thinking that he can arrest you for that crack you got sitting next to your D-104!

> Look, I'm not going to sit here and argue with you over this. Your

You've nothing to argue about. Below is an example of your CB enforcement fetish and willingness to deliberately troll CB-related forums with questions only an imbecile would honestly ask. Again.

Message-ID: <3A27619E.22EAE3F6@sccoast.net>

I was just wondering something about HR-2346? Since this allows local legislators to write laws based on FCC regulations, will that include the forfeiture amounts spelled out in the FCC regulations? In other words, are we talking about local courts handing out fines up to $20,000 for each rule violation? If so, that will certainly encourage local law enforcement officers to go after CB'ers with a vengeance (there are very few $20,000 speeding tickets).

> It's like this discussion. Contrary to your claim that I'm
> "announcing the
> passage of HR2346 with a big grin and wielding it like a club in every
> group that could possibly be of interest to CBers," I simply responded
> to a massage I read in rec.radio.amateur.misc. I didn't crosspost this

You responded to crossposted discussions, and further, I claim you took advantage of the crosspost situation to troll. If you disagree, please tell me what other possible reason could there have been to post the foolishness above. This post alone shows the degree to which your enforcement fetish encourages you to entertain hopes of cruel and unusual punishment visited upon the slightest violation (intentional or not).

> And, with that, I have nothing more to say about this. I didn't join
> this discussion so that I could get into an argument with you about my
> past posts.

Nor did I. You denied the existence of posts which were only a corollary to my statements, I proved them, and you are now backpedaling and attempting to shirk responsibility for what you had originally denied to exist. You showed lack of credibility on this issue better than I ever could.

>Instead, I offered detailed opinion about the enforcement
> efforts of the FCC (or lack thereof), and the issues surrounding
> HR-2346. If you can't offer any ligitimate dispute about what I posted,
> then don't waste my time with trivia like this.

Very well then, instead of waiting for you to shed your spankard's skin, become a man and apologize for calling me a liar, I'll take you up on your offer to legitimately dispute, dissect and expose the idiocy of this "detailed" opinion of yours, and re-examine the enforcement fetish and unreasonable bias causing you to uphold it. There's more than one way to skin a spankard. See my response to your original post.

The majority of hams would welcome Mr. FCC right into their homes.
No big deal at all. The penalty for the CBer however will come when
they come back with a warrent and take all radio equipment in the
house and maybe issue a 2nd fine.

FS 55' CZ-454-FS crank up-lay down Tristao tower with Towtec 102A electric raising winch. All mounting hardware. 3-20' sections, nests @20'11".

From shipping docs:

"Safely supports most tri-band beams such as the Mosley TA-33 and TA-26 and the HyGain TH6 DXX and others in 75 mph winds without guying (over 16 sq ft in 50 mph wind.) Designed for the ham with no space for guy wires. Safely and easily lowered during very high wind conditions. Large top section sizes for installing CDR and other rotators inside the top section for maximum strength. Removable rotator mounting plate furnished with all models. These free standing CZ crank up towers have 12-3/8" OD top sections and "FS" type hinged bases. Three 1'X36" anchor bolts and hinged base flanges are included for complete installation without a wall bracket."

Prefer pick up in Charleston, SC area. A very well priced unit @ 900 firm. Interested parties E-MAIL ONLY n4zn@amsat.org . Please, no tire kickers, no critics. You may leave a name/phone number to call.

Note: Follow-ups set to just rec.radio.amateur.misc

Dwight Stewart <stewartx@sccoast.net> wrote:
> Kim, we've already discussed this. If you delete newsgroups in a
>crossposted thread, many of the participants in the discussion will not
>see your comments, since many are not in the newsgroups you don't delete.

The usual procedure is to re-direct the thread, using the header's
"Followup-To:" line to just the group you're posting/reading, and
advise the readers that you've re-adjusted that line:

"Follow-ups set to just rec.radio.amateur.misc"

That will allow your comment to go to all NGs in the NG line one last
time, but any follow-up after that will appear on just r.r.a.m. Anyone
participating in the locked-out NGs will then be advised that if they
wish to continue participation, they'll need to come over to the NG
to which the thread was re-directed. (Brian Cantor was one smart
cookie when he wrote the Usenet software!)

I did that with this post; everyone on all 3 NGs will see it but any
follow-up to my comments will appear just here on r.r.a.m; my first
line above advises everyone of that.

It was scrapped because the average idiot couldn't believe that a pair of transistors didn't need another transistor to drive them with.

it proved over time not to work to
> well.otherwise it would be used.

It proved that the idiot who buys an amp can't figure out that it doesn't take 100 watts to drive a 2X2879 amp.

I can build an input circuit on a 2 pill that will allow it to do just as much as as a 1X2 with a stock radio driving it.

As a matter of fact, all my amps have a similiar style input circuit.

However, most morons out their believe "Well, DaveMade makes a 1X2 amp, so that means that ANY amp can be driven by a 2290".

> what is the big deal with the input anyhow

That comment alone proves you know jack shit buddy.

if it did have a bad swr all you
> would need to do is drive it with more watts , the watts would still end up
> the same on output

Moronic comment #4.

> Mark challenged people to act responsibly. What's so UPSETTING to you
> about that?

What is so upsetting is that when Dennis Ostrowski put Mark in check on various technical debates, proving him either an idiot or wrong, Mark went so far as to write his employer, and nearly had him terminated.

In return (I have heard), Mark had the living fuck beat out of him. I would have agreed on that opinion.

What is on a newsgroup stays on a newsgroup. You don't go after someones job because they seemingly are more intelligent than you, and you are incapable of having a debate with them on technical topics, nor do you do it because more people choose to follow their lines of thinking than yours.

You seemingly forgot to add that to your post.

He said, "if you don't like the CB rules, get them
> changed". It is possible. That's the way responsible people go about
> getting things done. But no. Instead you guys would prefer to slink

2847. Re: MURS Questions?

Newsgroup: rec.radio.cb
Date: 2000-12-17 17:44:28 UTC
From: "Scott (Unit 69 Chesapeake Bay)" <upplus@hotmail.com>
Message-ID: <3A3CFB7C.EDA7B9AD@hotmail.com>
Source record: 64230

Look, fat ass, here's your anonymous trolling post in RRAM 12-16-00:

The local CB'ers have gotten wind of the 'new' MURS frequencies that have
been recently been made available. Wouldn't you know it? The word is
spreading fast.
One of the locals has a two mtr. Ham rig he bought at a Hamfest and has
opened up...he is telling all his buddies to follow suit and 'get on the
air'. Two watts? Heck, they couldn't care less about the power
restrictrions! This guy is saying he's gonna put up some beams, get his wife
a rig and go for it.
The mess has begun. It will get worse. This clown said, "Nobody gonna
enforce it." if he runs fifty watts or more.
I think that the FCC really made a big mistake on this call and it won't be
long before these CB'ers begin to screw up the neighboring VHF freqs. with
their overpowered and broad-banded outlaw rigs.
The local CB'er was telling his buddies to spend a couple of hundred bucks
and buy an FM Ham rig from AES and modify it.
It is already happening. It will get worse.

Then you replied to yourself in RRAM 12-16-00 an hour and a half later:

Anonymous wrote in message <3a3b23d7_1@anonymous>...

>a rig and go for it.

I would not have a problem with using my dual-band HT with MURS . It's
been modded for out-of-band. Same goes for a 440Ht to use on FRS too.
All you need to do is get the shortest antenna possible and use the lowest
power, and noone will even notice.

>The mess has begun. It will get worse. This clown said, "Nobody gonna

It's going to happen for sure, but they will ruin it for the repsonsible
operators like myself. You can do alot with 2 watts and a good antenna.
Of course the truckers are probably allready using this MURS now anyway.

You're just pissed I made the connection!!

Its more like the new President said in a public anouncement with CNBC that the first of cuts to get the federal money system back where it needed to be was to do away with certain organizations. The first on his list was, yes you guessed it correct, the FCC. Seems like the president likes his communications as well.

I just read through everyone of your posts.

Lets say the load is 25 + j0 Ohms. If the 50 ohm coax line is 1/8 a wavelength long, what complex impedance does the generator see? What SWR does that result in? What if the line is a 1/4 wavelength long? And what if the line is 3/8 wavelength long? What if the line is 1/2 a wavelength long?

Enough quoting books, lets have some numbers.

Bob

Hey.....he knows how it works. He just didn't tell you the coax was lossy as hell! 2.7 to 1.2 SWR change from the source to load! Holy shit, what kind of coax is that?

Bob.

Ok Fred,

Lets say the load is 25 + j0 Ohms. If the 50 ohm coax line is 1/8 a
wavelength long, what complex impedance does the generator see? What SWR
does that result in? What if the line is a 1/4 wavelength long? And what
if the line is 3/8 wavelength long? What if the line is 1/2 a wavelength
long?

Number please. If your making a claim the coax length changes SWR and
your
qualified to make such a claim...fill in the numbers.

Scott.

>similar legislation several years ago and was not even involved with
>this legislation.

The ORIGINAL version of the bill was introduced in the Senate
by Senator Feingold about two terms ago and sailed through
the Senate. It did not emerge from committee in the House.
This was repeated last term with the same result. In the
present term it made it through because this time House
sponsors took the Feingold Bill and introduced it concurently
as the HR Bill that it is known as in this discussion.

The only differences between the original Feingold measure and
the one that finally made it through bouth houses and was
signed by the Prez are the exemption for the holders of valid
FCC station licenses introduced in the second version of the
Senate bill at the urging of the ARRL and the provision which
requires probable cause for enforcement against a commercial
carrier vehicle, no doubt introduced upon pressure by the
trucking industry to guard against real or perceived arbitrary
enforcement actions.

>He also fails to note that FCC policy has changed greatly since he
>left the FCC.

For the worse.

There are more and more people coming into power positions
within the agency who know not and care not what proper
radio regulatory enforcement is and why it is necessary.

Riley is a rare throwback to the "old days".

>For one thing, the FCC was directly involved in the
>creation of this legislation, and appears to fully support it.

The non-enforcement people surely do. It's easier to let
someone else do one's distasteful job than to shoulder the
responsibility and demand and get the resources to do it

properly.

>And finally, he keep talking about some jurisdictional issue that
>simply does not exist. If it did exist, it would have been addressed by
>lawyers at the FCC, the House, the Senate, or the White House, long ago.

If the FCC didn't speak up, none of the others could care.

And as I said, it's easier to let someone else do one's
distasteful job than to shoulder the responsibility and demand
and get the resources to do it properly.

Message-ID: <mb7q3tog89he17k71ejc071qd2g7odgh6j@4ax.com>
Source record: 64246

Greetings!

But, this is what makes it fun...

Lets get back to that example equation...

25 - 5j = 25 ohms, but a capacitive element.

Happened when I was using a 4' cheap fiberglass antenna with a mount picked up at a local garage sale...read:abused and cheap.

Now, if we were to really figure this out, we'd have the answer of 25 ohms, meaning we should be seeing a 2.7 SWR. We should be able to cancel out the capacitive reactance by simply substituting extra inductance.

OK, the antenna was shot, and it was too short. Now what?

Thats when the grins and giggles come in. It's dealing with a typical SWR meter, from your local CB shop. You know those kind, written with funny looking symbols showing country of origin - Hint:China.

Now you folks are bashing coax length, and you rightfully should. But, when the atypical CB'er comes across a bargain bin deal, well, we know the story - I was one of them...;-)

Take a look again at that smith chart. George was pretty close to the mark - we should see circles that intersect each other.

Ok, you with me so far?

You have to realize that we need to add inductance, so since we are dealing with a 25 ohm load on a 50 ohm coax, we shouldn't even get close to a low SWR. Correct?

Take a look at the opposing phase angle when we get coax to maximum inductance length on the "supposed open" line. We're at the 3/8 wave length - about 9 feet - well we should now see that SWR at 2.7 to 2.0.

Ok, so far, we are seeing that. But, there is a problem. The only way I could even see any SWR change was to try another patch cord.

Ok, here goes. We're adding another 9 foot patch cord on that silly mag mount antenna mess. The original cord was only 8 feet.

Check the SWR, I'm now at 1.2 - what is wrong?

OK folks, I'm going to let you in on a special secret. This thread shows how gullible you folks really are when it come to

troubleshooting problems in the real world. You don't ask for
clarification if all the bugs have been worked out. It's what I've
been saying all along...

The antenna was cut short, yet it can show a 1.2 SWR when the coax is
set for 17 feet. What was done wrong?

There are clues here.

Cheap antenna - mount was included with only 8 feet of coax.

Those two can easily point out the problems with the antenna setup.

Can you figure it out?

On Sat, 16 Dec 2000 17:18:22 -0500, while the modem was ice fishing
with the Mouse, Bob <bob@bob.com> dissertated the following:

:+> Trust me, this is no place to argue coax length. Whatever people want to
:+> believe is fine - it won't hurt them. You will talk till you're blue in
:+> the face, but some people here have their minds made up. They believe it
:+> so blindly they won't hear real discussion.
:+>
:+> Handy Andy believes you can "conjugate match" with the right length of
:+> 50 Ohm coax! Holy smokes!
:+>
:+> Bob.

In that boys eyes, all CB'ers use extra power AND do it on extra channels.
I've been accused of having extra channels so many times, I bust out laughing!

Maybe I can afford extra channels when I finish suing them for defamation
of character. This is a litigious society.

Andy, you are already making mistakes on the basics 25 ohms is a 2:1 swr
just the same as 100 ohms being a 2:1 swr ... I dont know where you get 2.7?

.......I'll put it here again... but it's been posted MANY times before...
it is a MYTH that NOT having a license frees you from ever having to let the
FCC inspect your station. Those who beleive this myth would probably think
they can drive 95 mph in Ohio because the OHIO State patrol has no authority
over their Michigan drivers license.... it's the same faulty logic. If you
operate a radio, licensed or not, FCC rules apply. (anything that
transmits... and many that don't, are under FCC jurisdiction).
......If you'd like to do the research yourself, go to FCC.gov... from
there, use the the link go to the enforcement burea page and look around the
lower center of the page for a link to a page detailing FCC inspection
policy and related information.

Heats sinks are made from aluminum. Circuit board are made from fiberglass. The traces are made from copper. Tin is a part of solder. The other part of solder is lead. That leaves what to make cans from?

I want to put up a base station in the rather small town I live in. I was thinking about putting the pole right next to a tree and securing it there. The tree is at the back of my yard and was thinking of running my coax underground to the house.
Would that have any effect on the performance of the radio? Would I get any type of performance troubles being right next to the tree?
Thanks.

I've ran coax underground.The best result I had was to run it through pvc pipe first and then bury it. This gives it protection from elements and vermin. The tree may or may not affect it. Will your antenna be above the tree?

Ckrepp,
The antenna being next to a tree will affect it to some extent,
how much is something you'll just have to try, to see. There are
types of coax that can be burried with no ill affects, just ask
the manufacturer (Sorry, I can't rememeber the ones that can be
burried).

Handy Andy,
I think you had better go back and try that again. Your
doing exactly what you are arguing against. Your 'cure'
with 50 ohm coax won't work, (try using 75 ohm), as a
conjugate match in this instance.... sorry.
'Doc

Scott, I think you have a point. I suspect there will be no descernable difference on the upper HF bands (including 11 meters). If skip were in, I don't know if the shadow would last long enough for the F layer to move much towards it's nightime position; however, I do suspect that the D layer would rapidly de-ionize (is that a word?). Essentially, I would suspect the lower HF frequencies would enjoy a minor 'enhancement'. The 7 HMz band would be allowed a lower take off angle without being completely absorbed by the D layer, hence you might see some longer distances achievable. This would, of course, be in the direction of the moon's shadow. The 80 meter band may enjoy some high angle skip for a short while during the day - again in the path of the shadow. For the most part, however, I doubt the hams will be sitting at their rigs drooling over the thought of working a station several hundred miles away just because the time is not 'right' for that kind of propogation; obviously, just waiting until nightfall will allow you the normal thousands of miles range. This is pure conjecture on my part and I doubt if anyone will notice it. However, you make a good point about the D layer - it absorbs the lower HF during the daytime and it rapidly disappears without constant solar radiation. Thanks Scott, for an interesting point on the D layer. Gee it seems good to see some posts other than the inane 'illegal' posts, doesn't it!

I believe Doc is absolutly correct. Try it and see how it works. The best antenna I ever had was strung amongst trees. It ran 30 to 50 feet in height and was several hundred feet long. I worked the world with that thing and 65 watts.

Don't forget to use Coax Seal or something similar to keep the moisure out.
You will have some condensation in the pvc, but you want to avoid having
the thing just sitting in water, If nothing else, it will begin to get a
bit smelly.

The SWR at 25 - 5j ohms is 2.03:1.

> OK, the antenna was shot, and it was too short. Now what?

If depends if you call 2.03:1 low.

> Take a look at the opposing phase angle when we get coax to maximum
> inductance length on the "supposed open" line. We're at the 3/8 wave
> length - about 9 feet - well we should now see that SWR at 2.7 to 2.0.

No.

With 3/8 wavelength of transmission line, the impedance is 47.2 -34.9j
ohms. The SWR is 2.03:1. Hmmm, same SWR!

> Ok, so far, we are seeing that. But, there is a problem. The only way

>
> Check the SWR, I'm now at 1.2 - what is wrong?

Your example is what is wrong.

Add another 3/8 wavelength of transmission line, and the impedance
becomes 96.2 + 19.2j ohms. The SWR is 2.03:1. Hmmm, same SWR!

> OK folks, I'm going to let you in on a special secret. This thread

Your measurements (or calculations).

> There are clues here.
>
> Cheap antenna - mount was included with only 8 feet of coax.
>
> Those two can easily point out the problems with the antenna setup.
>
> Can you figure it out?

I did. The coax length did nothing to the SWR. Your example is flawed.

OK. What is the imaginary component (the part multiplied by j) of
an impedance when XL=XC?

Answer: zero

> For example the resonance of free space is 377 ohms.

No, that is the "characteristic impedance" of free space.

> You have narrowed the universe to a specific set of conditions which
> has no application in the real world. A million CBers have
> changed the length of their coax and observed the SWR change. Why?

If so, then something else has changed. Perhaps the attenuation
was changed by virtue of a different line length. Attenuation
is a function of line length, is it not?

Perhaps their transmission line isn't truly 50 ohms or perhaps they
have a bad meter.

Now, answer these questions:
1) What is the antenna impedance (including imaginary part) when
the SWR is 1:1?
2) Is that impedance resonant?

3) Since it is resonant, can we not say that resonance is a
requirement for a 1:1 SWR?

No. 50 ohms is 50 + j0 ohms. There is only one combination of R and X.
If there is a reactive component, it is not 50 ohms.

Darn, Phil, why do you wait till now to respond with some substance to the things I've said? I've got work to do and have to back out of these discussions (so pardon me if I'm a little slow to respond to future comments).

Anyway, I'll agree with you that this legislation is not the best solution. And, like you, I'd rather see the FCC handle this situation. But, what I've been trying to say all along is, in the current environment in Washington, is that realistic?

In many government agencies, budget cuts and downsizing has become the holy grail. With this in mind, do you really think that the FCC is going to get more money, and more staff?

At the same time, complaints from consumers has reached an all-time high. Yes, you and I know this is because of the flood of new electronic devices in the home (often poorly designed to handle radio interference), but try telling all that to some consumer (or some congressman) that can't record his favorite show with his new VCR.

In the end, this leaves the FCC between a rock and a hard place - complaints and budget cuts, or complaints and downsizing. Put yourself back into the FCC today, with this situation. What would you do?

In the end, it appears the FCC decided to cut its losses, to throw a radio service it didn't particularily like anyway to the wolves, and to concentrate more heavily on the radio services it could handle.

Its a dirty deal. Its an unfair deal. And I'm sure a lot of CB'ers feel betrayed. But, at the same time, many would argue that the FCC was

spending way too much of its time, and resources, on this one radio service anyway (one radio service out of many).

Anyway, its a done deal now. The goal now has to be to keep an eye on local legislators to make sure they handle this situation properly. It may be years before all this settles down to some level of normalcy again.

And you are totally wrong. Give just one example of your claim. You
can use any length of 50 ohm transmission line with any antenna
impedance that is not 50 ohms. The impedance changes but never gets
to 50 ohms. The SWR does not change.

> No 1/4 mobile antenna is 50 ohms. A perfect 1/4 wave over perfect ground

If it is not resonant, then it is not 50 ohms.
Give just one example to show how to do this.
I'll give you $100 if you can.

Well, Fred simply has "an extra class license and a masters in electrical engineering" so he doesn't want to "approach a problem with the complexities of transmission line theory." (his words)

He said he could use an 18 feet piece of 50 ohm coax to match a 37 ohm load. But he quieted down when I challenged him to show how.

I just posted the answer to a very similar problem in another post. However, it was 25 - j5 ohms instead of 25 + j0 ohms.

And guess what? The SWR never changed. Go figure.

Good memory, Fred. Correct. I probably shouldn't join in the fray, but my concern is that if someone simply writes to flame, it does not reflect well on the amateur community. Certainly, if someone asks a question, an honest answer is in order - otherwise, I fear the average individual reading this newsgroup will get a bad impression of hams (could well be some SWLs 'reading the mail' so to speak). By the way, a fellow I served with in Vietnam waters had seen a few posts and sent me an e-mail asking who I was - he sent a second e-mail before I had read the first stating yes, I was - he looked it up on qrz.com and saw the old callsign. You just never know who is reading. It was a blast from the past - and a welcome one, I might add. We were both radiomen attached to Commander, Amphibious Group 1 in the US Navy back around 1968 - 1970.

Let's look at your original post:

What's the calling freq?

What will be the truckers freq?

How can any of this be determined since the FCC has only approved the frequencies, but not any equipment? Sounds like a troll to me.

To put it another way, the FCC has said that no CB frequencies, other then channel 9 (27.085), will be reserved for the exclusive use of any operator or mode.

Shall I use my Jobcom radios on 154.57 any way I see fit? It would be fun to mess with the local country clubs and hotels. Hell, I'm gonna hook it to my scanner antenna and see if any of the local hams I talk to on my CB would like to make the trip on simplex!

Bob <bob@bob.com> wrote:
: I just read through everyone of your posts.

: Lets say the load is 25 + j0 Ohms. If the 50 ohm coax line is 1/8 a
: wavelength long, what complex impedance does the generator see? What SWR
: does that result in? What if the line is a 1/4 wavelength long? And what
: if the line is 3/8 wavelength long? What if the line is 1/2 a wavelength
: long?

Figure the input impedance yourself. My apologies for the nested parens,
and the lack of Greek symbols.

r(in) = ra(1+(tan^2 bl))/(1-xa(tan bl)^2+(ra(tan bl))^2)
x(in) = (xa(1-(tan^2 bl))+(1-ra^2-xa^2)(tan bl))/(same denominator as above)

l is line length (in feet or meters)

This is the normalized value - so is valid for a 1 ohm line.

To convert to another line impedance, use the following:

ra=Ra/Z0 , Rin = Z0(rin)
xa=Xa/Z0 , Xin = X0(xin)

Ra and Xa are the load resistance and reactance and Rin and Xin are
the resistance and impedance at the input end of the line.

bl(degrees) = 1.2f(MHz) x l(meters) or 0.367f(MHz) x l(feet)

: Enough quoting books, lets have some numbers.

For all line lengths, the SWR will be 2:1, although your SWR meter may
not indicate that value at all measurement points.

If the load impedance is 0 = eg, the antenna is resonant, then the
following will be approximate results from the above equations:

1/8 wave line length xin = 0.5 for ra=0.5 and 1 for ra<=0.1
1/4 wave line length xin = 0 for all ra
3/8 wave line length xin = same as 1/8 wave
1/4 wave line length xin = same as 1/4 wave

1/8 wave line length rin = 0.1 for ra=0.1 and 1 for ra>=0.5
1/4 wave line length rin = 8 for ra=0.1 and about 1 for ra>=0.5
3/8 wave is same as 1/8 wave
1/2 wave is same as 1/4 wave

Remember that these are normalized values.

Message-ID: <3qfr3t0jas9vqn2mpr37nimtn21obh2d7s@4ax.com>
Source record: 64350

Greetings!

I'll go into it further, all the "coax police" are acting like the Keystone Kops on this...it's hilarious!

Ya' gotta love these people.

Not one of you got the hint.

I guess I'll have to connect all the dots...

If you remember the Magnetic mount, and how I got it, being used and abused. The antenna itself too.

No, I didn't replace the coax,

No, I didn't check the PL259 connector,

All I did see is RG-58 on the jacket.

It was 8 feet long.

I didn't check for shorts, or opens...

But, in the end, I was able to see an SWR of 1.2 - but the meter was never steady.

Now, with the above in mind.

Did I tell you the location I put this at - no.

It was on the trunk lid of my 76' Chevy Nova. You know the type, 262 V8 Rochester 2GC carb, and all unibody rusted hulk of a vehicle.

Now, if things worked like they should - I will say again, I should have seen a 2 SWR.

The first time I did. Actually it was a 2.7 SWR - placing you hand on the coax or meter at the wrong spot gives you an unsteady SWR reading.

Thats a good clue...

This was using the original coax that came with the mount.

I grabbed a barrel connector and added on a 9 foot patch cord.

Now the SWR was 1.2.

Did I check continuity? No.

What finally came out was the 8 foot coax section not only was bad, it has a weak short due to water entry at the mount.

So what it means is, even though it should have been RG-58 - it wasn't perfect coax to begin with.

Adding on a patch cord in length did something to the SWR.

The mess would show a near pefect SWR on some days, others it wouldn't.

The point I'm trying to bring up with all these people making these assumptions...

Did you ever bother to ask the guy what they did by themselves in an attempt to correct a problem?

Considering I had a 1.2 SWR - I could have just left it at that. And for a while I did, it was only a cheap TRC-412 at the time I was using anyways.

The only reason why I have some information - is because I had kept the antenna and mount in a shed. When I moved to my current location I came across that antenna and with my MFJ I wanted to see something. I can't re-create the car, so I used the Aspire.

The reason why I kept it was because of the friendships it created. There's a lot of memories for a person starting out in something new.

This is what makes me laugh at you guys, you too literal in terms and are not willing to make an effort to open your mind to other possible reasons why things work the way they do.

Sorry dudes, you folks really know how to ramble on.

This thread is case and point.

If a CB'er doesn't put their stuff together right, you have a problem.

You never ask "Why?" or "What is the problem?"

I've re-created it for you and you still don't understand...

Sigh...You guys are phonies. You haven't even tried...

Ask the person if they've done their homework and put the stuff together right. This is why the coax length stuff comes up in the first place.

Improper assembly.
Didn't double check their work.

The two sentences above are the ones you guys should really be looking at when it comes to your conduct to people that ask a question about coax.

I don't have to go into this any further, the atypical [no one in particular] CB'er is no one special - just wants to use a radio.

They don't have any special tools, not one clue about a smith chart. They'll be dammed if they're going to a Dennys and ask a bunch of Hammies sitting for coffee he was invited to join over his radio, and ask "Coax length" questions. [The reactions to this topic are as close to textbook cases of Signmund's own signature line with a mix of Twain too - LOL!]

If this thread stays on deja-news - I hope that the persons having the problems with antennas read this. It's a perfect example on how people over-react to such questions.

Some know how to answer, others know an answer, but only one has asked what the problem is.

Think about your conduct.

<anylength@willdo.com> wrote:

>Now, answer these questions:
>1) What is the antenna impedance (including imaginary part) when
>the SWR is 1:1?

The antenna impedance can be any combination within the boundaries of
the equation

Z = (R² + X²)^½

There is an infinite number of possible combinations of resistance,
capacitive reactance and inductive reactance which will yield 50 ohms.
Using an arbitrary value, 22.36 + j44.72 ohms = 50 ohms impedance at
the antenna. This is Example #2.

>2) Is that impedance resonant?

Certainly not, and the question is moot: 'impedance' is neither
resonant nor non-resonant.

I think _you_ need to look up the definition of resonance. The
effective impedance of a resonant circuit can be _any_ value depending
upon the values of the components, including any resistive component
that may be present.

>3) Since it is resonant, can we not say that resonance is a
>requirement for a 1:1 SWR?

No, since it is not resonant. A 1:1 SWR can be achieved with only a
resistive component, which does not contain any capacitive or
inductive reactance, and therefore cannot be resonant. That was
Example #1.

I suspect you will now say that an antenna must resonate in order to
be called an antenna. For Example #3, take a look at the antenna on a
modern scanner that covers 30MHz to over 1GHz. That antenna is not
resonant, and neither is the AM antenna attached to your car radio.

"Only transmitters", you say, ignoring the law of reciprocity. Sure,
it is more efficient to make the antenna resonant, but it is not
required. When the antenna is too short, as in the case of most AM
broadcast stations, a non-radiating reactive element is added to
cancel the reactance of the antenna and bring it to resonance. I'm
sure you have heard the terms "center-loading" and "base-loading". But
wait; you said that a resistor is not an antenna - does that hold true
for a non-radiating reactance? I guess that doesn't matter anymore

since neither of them radiate when the reactive antenna does. That was Example #4.

You wanted one example, I gave you four. Where's my money?

Sparky, still waiting for your references.

>also.

Check with auto salvage yards, especially those who specialize in
Ford parts. Often, the mics were pulled and stored indoors, but
the main units were crushed with the stripped vehicles.

I remember the CB unit you're describing. I was in college in '78
and worked part-time at a Texaco filling station. The boss had a
brand new '78 Bronco with that CB unit installed in it. Nice set!

BUT AS WAS SAID EARLIER... MAKING THESE AMPS IS ILLEGAL!!!!
DAVEMADE MAKES HIS AMPS FOR COMPETITION ONLY OR SHOULD I SAY MAINLY.
NOW THAT YOU HAVE ALOT OF GUYS WANTING THESE GOOD QUALITY AMPS AND THEN
VIA THIS INTERNET SHIT, CAME A MANY LITTLE GROUPS OF GUYS WANTING TO
CAPITALIZE ON THIS AND SELL A PRODUCT. SOME COPIED SOME IDEAS BUT
MAINLY DID THEIR OWN CONSTRUCTION (NONAME) AND SOME JUST COPIED THE
WHOLE DAMN DAVEMADE DESIGN, EXCEPT FOR CHANGING THE COLOR (X-FORCE) NOW
INSTEAD OF THE SELECT FEW THAT USED TO HAVE ACCESS TO SOME OF THE OLDER
BUILDERS AND DESIGNERS (DAVEMADE) YOU HAVE A WHOLE LOT OF GUYS JUST
CLICKING THEIR MOUSE AND GETTING AN AMP!!
NOW THAT IS THE SHORTENED VERSION OF THE GOSPEL TRUTH!!!!
BRAND SPANKIN' NEW HAS SPOKEN!!!!!!!!!!!!!!!!!!

Greetings!

Well, I currently use a tree to hold my antenna. It works pretty well and to this day I've had no problems.

In regards to the tree, you'll find performance during the winter months to be a little better than in the spring and summer. Something about all those leaves and water coursing thru the trunks - creates a little bit of an attenuation problem if the antenna is up there in the canopy versus above the treeline.

Performance? Well, in light of trees - they are good lightning attractors. Take steps to avoid direct strikes to the radio equipment if you can. Make a break point by the house if you can, so the coax can be disconnected outside, to reduce this problem from entering the house.

As far as "burying" the line. You can, but you should seal it up well. An expansive foam injected into the conduit line can help keep out rodents, water and insects that might like to burrow into the conduit. You mentione PVC so use the right adhesive [that purple primer too] and go ahead and bury it.

However, as a method to help it, make some right angle joints at the ends too - to help create an upside down U or J-shape for a method to drain off water that would otherwise want to follow down the coax and cause penetration into the pipe. Set these vertical and allow the coax to droop down. Any water on the coax exposed on the outside can drain off, the internals of the conduit can stay dry allowing the water to drip off staying outside.

Once you've sealed it off and have the drip droops planned, you can bury it - at least 8 inches if you can to reduce exposure. If it's sealed properly, you can bury it at a depth in the frost line as long as you don't have excessively long runs. Otherwise frost and ice might cause a crack or two. The sealant can help prevent bursting or collapse if the ground heaves during the thaw. If you don't want to bury it, you can route it along a line like the patio porch or along the foundation above the ground too.

The biggest problem with water entry is at the coax ends - where the connectors need to be sealed well. That is the biggest problem and causes the coax to get ruined real quick.

On 18 Dec 2000 00:30:59 GMT, while the modem was ice fishing with the Mouse, ckrepp@aol.comonover (Ckrepp) dissertated the following:

:+> I want to put up a base station in the rather small town I live in. I was
:+> thinking about putting the pole right next to a tree and securing it there. The
:+> tree is at the back of my yard and was thinking of running my coax underground
:+> to the house.
:+> Would that have any effect on the performance of the radio? Would I get any
:+> type of performance troubles being right next to the tree?
:+> Thanks.
:+>
:+>

cool, i agree with this post. i have a question for ya. how much space
should there be between the roof of a long nose and the coil of a
center loaded antenna in order to get good swr match???,.....head
out....

This is when your true stupidity shows the most. Davemade could not furnish the orders that we were selling fast enough at the time. Nothing against Davemade due to the fact that there products are good too. I just made a business move that has worked out much better. As for Express, they are a great company as well. Ask the CEO how much he spends when we send him products of all sorts. Hope you have a Merry Christmas and eat dinner without your panties in your crack.

Complaints have reached an all time high? From where does that bit of incorrect information come from? Riley himself said complaints have DECLINED, which is why the enforcement log was scaled back to twice a month. Does this sound like an increase to you? Forget it. Go listen to Riley himself tell you complaints are down.

Right on! The only time a transmission line will radiate is when it
has common mode currents which flow on the outside (and not on the
inside). In this case, the net current is nonzero and it does radiate.
But, we are not discussing this case.

I agree with you, jdaggett, but Sparky needs a reference.

> coax length has only an effect on the impedance seen by the source. It

You're rollin' again!

> As we move away from the load toward the source along the circle of constant
> SWR there will be two points on the circle whose complex impedance will equal
> 50 Ohms.

Aw, man! You lost it again. There is only one 50 ohm point on the
whole Smith chart. It is dead center. And the circle of constant SWR
revolves around it and never gets closer to it.

> That is the square root of the sum of the squares of the real and imaginary
> parts will equal 50.

What you describe here is the magnitude of the impedance. It is not the
impedance.

> These two points are arrived at by moving along the coax
> from the load toward the source. It should be noted that the two point will be
> half way arround the circle of constant SWR.

The coax input impedance is never 50 ohms in this case.

> It should be noted that the same two points are reached everytime we go a
> halfwave down the coax. Either one of these two points can be our
> starting point. Since the impedance seen looking into the coax toward the
> load is now 50 Ohms, the source is 50 Ohms, the SWR meter reads 1:1.

No. Absolutely not.

The SWR is 1:1 only when the impedance is 50 +j0 ohms. You had it right and now are contradicting yourself. You said the impedance travels on a circle of constant SWR and now you are saying the SWR is different. What gives? If the magnitude of the reflection coefficient (the distance from the Smith chart center to the impedance point) has not changed, how could the SWR change? You said yourself that the reflection coefficient determines the SWR.

They have a term for those that break the law and think they have an out. It is "Jail house Lawyers". I have read more misinformation on here! As you have so ably pointed out if one goes to the regulations, there in big bold letters it says that inspection of a CB radio station is authorized with OUT a search warrant and that refusal to allow inspection is a violation punishable by fines, even if the station turns out to be totally legal. Even more amazing is that if someone attempts to provide information, people are more concerned about a spelling error (purposed rather than proposed) than the information being provided. My mail box has been filled by some of the filthiest messages one can imagine by those that have taken umbrage with the information provided. I can only hope that the lowlifes are first on the target list, they are a disgrace to CB operators everywhere.

G Seven,

Not really. The regulations clearly spell out FCC's authority to in-
spect ANY station within their jurisdiction. In a nutshell, even tho
CB stations do not hold a "paper" license, they *are* licensed in the
sense that, by the act of operating a CB station, you are agreeing to
abide by the rules which include that inspection authority. There is
a reason why the rules give the this option. As was previously said,
when the agent(s) show up at your door, they already *know* that the
problem (interference, excessive power, etc) is coming from your loca-
tion. Their equipment is quite accurate. So, if the inspection is re-
fused, the operator has time to get rid of the "evidence" thereby negat-
ing FCC's ability to enforce the regulations. Since, by operating a
station, licensed or not, you have *agreed* to abide by the federal law
and, again, that includes allowing your station to be inspected, you
forfeit any "right" to refuse. So, while it is your prerogative to
refuse to allow entry without a warrant, they STILL have you on a
violation--refusal to allow the inspection. Gotcha either way, eh?
Having a license, ham or otherwise, isn't an advantage or disadvantage
here.

No.

Z = R + jX

You are calculating the magnitude of the impedance; not the impedance.

> There is an infinite number of possible combinations of resistance,
> capacitive reactance and inductive reactance which will yield 50 ohms.
> Using an arbitrary value, 22.36 + j44.72 ohms = 50 ohms impedance at
> the antenna. This is Example #2.

Absolutely false, there is only one 50 ohm impedance: 50 + j0 ohms.
This is the ONLY impedance which yields an SWR of 1:1.

> >2) Is that impedance resonant?
>
> Certainly not, and the question is moot: 'impedance' is neither
> resonant nor non-resonant.

Impedance is, indeed, not necessarily resonant or non-resonant.
However, for a perfect match, the impedance must be resonant.

> I think _you_ need to look up the definition of resonance. The
> effective impedance of a resonant circuit can be _any_ value depending
> upon the values of the components, including any resistive component
> that may be present.

The impedance of a resonant circuit is, by definition, the resistive
component; there is no imaginary component in a resonant circuit.

> >3) Since it is resonant, can we not say that resonance is a
> >requirement for a 1:1 SWR?

>
> No, since it is not resonant. A 1:1 SWR can be achieved with only a
> resistive component, which does not contain any capacitive or
> inductive reactance, and therefore cannot be resonant. That was
> Example #1.

??? You make no sense.
You say a 1:1 SWR must have only a resistive component (the definition
of resonance) but cannot be resonant.
Let me paraphrase you: "It must be resonant but it cannot be resonant."

> I suspect you will now say that an antenna must resonate in order to
> be called an antenna. For Example #3, take a look at the antenna on a
> modern scanner that covers 30MHz to over 1GHz. That antenna is not
> resonant, and neither is the AM antenna attached to your car radio.

An antenna need not be resonant. But, for a perfect match, it
must be resonant.

> "Only transmitters", you say, ignoring the law of reciprocity.

What are you talking about? You are again attempting to put
words in my mouth. I said no such thing.

> Sure,
> it is more efficient to make the antenna resonant, but it is not
> required. When the antenna is too short, as in the case of most AM
> broadcast stations, a non-radiating reactive element is added to
> cancel the reactance of the antenna and bring it to resonance.

I have no problem with this statement.

> I'm
> sure you have heard the terms "center-loading" and "base-loading". But
> wait; you said that a resistor is not an antenna

Do you think a resistor is an antenna?

> does that hold true
> for a non-radiating reactance? I guess that doesn't matter anymore
> since neither of them radiate when the reactive antenna does. That was
> Example #4.
>
> You wanted one example, I gave you four. Where's my money?
>
> Sparky, still waiting for your references

Example #2 was inaccurate. Your definition of impedance is wrong.
You do not understand that there is only one impedance, 50 + j0 ohms,
where the SWR is 1:1.
Example #1 was inaccurate. You have contradictory definitions of
resonance.
Example #3 proves nothing.
Example #4 attributes a statement to me that I never made yet

still proves nothing.

You're going to have to work harder, Sparky.

First if you can supply with the name of your banker for proof you have $100.00 I will give you enough examples to last a life time.

Your statement below is pure bovine excrement. If I were to have a folded dipole antenna, the 1:1 value would be 300 ohms. A standard dipole is 72 ohms, let me put the shoe on the other foot. Show me any antenna that is 50 ohms at resonance without the aid of a matching network.

CD, it depends. Might work, might not. If you are talking skip on CB, they *might* be able to pop ya regardless of license. Then again, due to the license, they may have to refer it directly to FCC. The federal law says that they *may* (the locals) write ordinances regarding interference. So the officers would have to be responding to a complaint about you interfering with Widow Jones' TV, for example. They won't be able to hassle you just because they see you talking on a radio.
i think there are
> many things that must fall together before this thing takes hold and

Locals still won't be able to just walk up, see an "illegal" radio and take it away. I believe you would have legal recourse against "rambo" cops if they did this. The new law, as written, just doesn't give them that authority. There has to be evidence of interference before they can do anything.

Same old debate tactics, "he didn't respond so I am right" I just do not engage in nonsense. I made a very basic statement that can be checked in any text book.

1. A shorted 1/4 length of coax is seen as an open.

2. A shorted 1/2 length of coax is seen as a short.

You disagreed with these easily checked premises, at that point to continue a technical discussion with you would prove futile. You have the advantage of creating new electrical law, where as I am bound by the facts. That puts me at a disadvantage I can not hope to over come, ergo you win pick up the marbles.

th,

I think I read that, due to lobbying by the Truckers' Association(s), they won't be able to do that under the existing law. It only applies to local interference. A truck wouldn't necessarily be in a given area long enough either to cause *much* interference or be tracked. I don't think the DMV/HP guys can just sit at a weigh station poppin' guys for illegal(?) radios. If I am wrong, can you fill me in?

Hey Jer, consider this scenario...a complaint is called in, a team of hammies aiding cops, or whatever they decide to use comes to ones door to "inspect". I understand they CANNOT enter under any circumstance unless they have a warrant or evidence a crime is committed. What if the operator isn't home? Does it automatically go to the "refused to let inspect" file and get treated as such? Oh, and someone mentioned another scenario. Cop comes to the door to inform you they have a complaint, there is drugs and/or paraphanalia in view of the officers sight. Can they enter? Of course they can, no warrant needed when the officer has reason to believe a crime is being perpetuated. Oh, one may get off with a good lawyer and a loophole or two, but make no mistake, one WILL initially go to jail. Same with domestic violence. If a neighbor calls and reports a disturbance, the officer arrives and knocks at the door, nobody answers, but the cop can hear what he PERCEIVES to be the woman (or man in some cases) getting the shit beat out of her, can he enter? Absolutely!

The misinformation I think lies with the "right to inspect" clause. You can refuse entry without refusing inspection of your station. Here is another clause for ya' to chew on Freddie, if an illegal op gets a visit by any LEO requesting to see the station, just say, "Sure, wait here, I'll go get it." Like many have stated, the law, as it sits, is too vague to have teeth, save truckers.

See my previous post, Jer. It says "refusal to let inspect.....".
Well, here is what may be first challenge to the law. "Yes, sir,
certainly you can see my radio. Wait out here, I'll go get it".
While this may not seem likely, it can definitely be employed, and if
it came down to the wire in court, methinks said offender would get off
since you actually "Allowed" for an inspection. They would have to
redefine inspection and use the word "entry" or some similar term...and
then it would get REAL sticky. I don't see the Feds granting that broad
authority....and I'M the paranoid one.

>However, for a perfect match, the impedance must be resonant.

An antenna is a load, just like any other load with reactance and/or
resistance. There is no electromagnetic property that makes an antenna
any different than any other reactance or resistance, because they all
have both to some extent.

>> I think _you_ need to look up the definition of resonance. The
>> effective impedance of a resonant circuit can be _any_ value depending
>> upon the values of the components, including any resistive component
>> that may be present.
>
>The impedance of a resonant circuit is, by definition, the resistive
>component; there is no imaginary component in a resonant circuit.

That wasn't what I said. You can have an infinite number of values for
any LCR network that is resonant at a given frequency. THAT is what I
said.

>> >3) Since it is resonant, can we not say that resonance is a
>> >requirement for a 1:1 SWR?
>>
>> No, since it is not resonant. A 1:1 SWR can be achieved with only a
>> resistive component, which does not contain any capacitive or
>> inductive reactance, and therefore cannot be resonant. That was
>> Example #1.
>
>??? You make no sense.
>You say a 1:1 SWR must have only a resistive component (the definition
>of resonance) but cannot be resonant.
>Let me paraphrase you: "It must be resonant but it cannot be resonant."

Let me paraphrase for myself: "A 1:1 SWR _can_ be achieved with only a
resistive component . . ." Don't substitute my words for yours.

>> I suspect you will now say that an antenna must resonate in order to
>> be called an antenna. For Example #3, take a look at the antenna on a
>> modern scanner that covers 30MHz to over 1GHz. That antenna is not
>> resonant, and neither is the AM antenna attached to your car radio.
>
>An antenna need not be resonant. But, for a perfect match, it
>must be resonant.

. . . oh, brother. Read a goddam book!

>> I'm
>> sure you have heard the terms "center-loading" and "base-loading". But
>> wait; you said that a resistor is not an antenna
>
>Do you think a resistor is an antenna?

Yes, albeit a very poor one, but for all practical purposes it is not.
That is not the point here, though.

>> does that hold true
>> for a non-radiating reactance? I guess that doesn't matter anymore
>> since neither of them radiate when the reactive antenna does. That was
>> Example #4.
>>
>> You wanted one example, I gave you four. Where's my money?
>>
>> Sparky, still waiting for your references
>
>Example #2 was inaccurate. Your definition of impedance is wrong.

It is the same definition that has been used for over a hundred years.
Did you change that, too?

>You do not understand that there is only one impedance, 50 + j0 ohms,
>where the SWR is 1:1.

Where is your reference? A Smith chart? That is only a tool to be used in combination with intelligence. If what you say is true, then there should be no need for 75 ohm coax, or even ladder line. Or baluns. Or any other type of antenna matching device.

>Example #1 was inaccurate. You have contradictory definitions of
>resonance.

There is nothing contradictory about the definition I used. It is the same definition that is used by EE's daily.

>Example #3 proves nothing.

Except that non-resonant antennas work.

>Example #4 attributes a statement to me that I never made yet
>still proves nothing.

To you. But to a thinking, open-minded individual . . .

>You're going to have to work harder, Sparky.

And you are going to have to read a book. Does that scare you? Are you afraid that you will find out that you are wrong about most of the BS you have been dishing out?

I expected you to find some reason to welch on your offer. But I didn't expect such a lame excuse as "that proves nothing". You are the only one here that continues to make claims that are in conflict with many, if not all authoritative references, and you cannot provide anything to rebuke the claims of others. I don't know why you keep flapping your gums without any way to support your ideas, but until you do, many people here will consider you to be either a liar or just an ignorant troll. Your choice.

Sparky, FLRC

They would probably return if it was evident that INDEED no-one was home.
If cars are in the drive and lights are on in the house, they may assume
you're refusing the inspection though. I would think they would attempt (at
that point) to visit while you're on the air. They WILL correspond with you
via certified mail... if you then refuse to answer or grant an inspection,
fines will probably follow.

I beg to differ - he is not in your house under standard "consentual search" laws.. he is there enforcing FCC regulations checking your equipment, NOT as a police officer but as a sort of quasi-FCC agent.. If it had been different, like he heard screaming from the house, knocked on your door, and you let him in, he'd be there in a totally different capacity.

It would be interesting to see this sort of scenario and see how it played out in the courts.. I bet there would be quite a precedence set with that one..

Jerry it is the sort of brownish stuff that is about 3 microns thick that is located on the extreme circumference of the non dialetric portion of the inner conductor. If you look real close you can see the 50 engraved in it. A common mistake that many people make, is the failure to observe it. An MFJ259B enlarges the letters and makes them easier to see, once the coax is carefully cut to 18 feet. ;>}

That's an interesting point - again, I am not really familiar with the new law, so can someone confirm if this is correct? Do you actually have to take the FCC to where your radio is hooked up, or can you bring your radio to them? If this is the case, it seems like quite a loop hole - all someone would have to do is bring a $40 Radio Shack CB to them and say "this is what I'm using"...

Thanks Bill, I already know the answers.

If you would like to know how these other guys come up with different SWR with different lengths, let them answer the question.

They make statements like input impedance is transformed by different lengths of 50 Ohm coax (it is) but whatever value it is is black magic. Half these people don't even know what reactance is.

Certainly none of them know how to use a Smith Chart.

Bob.

Sparky, you refuse to quote your textbooks verbatim.

And you cannot answer simple questions to your claims. You have claimed
that reflected power is constant while a transmission line radiates.
How are both simultaneously possible? Where is the radiated energy
coming from if the reflected power stays constant all along the line?

How can RF radiate through the shield of a coax?

I shoot holes in your claims and you cannot respond.

Hey Sparky, answer Fred's question (which he refuses to answer despite
having an extra class ham license and a masters in electrical
engineering): What length of 50 ohm coax is needed to match a 37 ohm
load to 50 ohms?

You are allowed to use all the textbooks you want to justify Fred's
claim. You simply can't. Fred can't either.

Stop the myths and old wives' tales.

>
> Thats a good clue...

That sounds like you may also have had a small amount of antenna current flowing on the outside of the coax shield too. Antenna currents flowing on the outside of a coax cable are known for screwing up readings on SWR meters. By grabbing the SWR meter, or the cable at different places, which alters the coupling of the coax cable to the surroundings, can result in a different amount of antenna current flowing on the outside of the coax. If all of the RF current was confined to the inside of the coax, and the antenna well grounded at the base, you should have not seen any variation in SWR reading. By changing the length of coax cable the position, and magnitude of the current node maximum, on the outside, was moved relative to the SWR meter, thus the SWR meter reading would change. All of the cheap HF SWR meters I have seen use a toroid type current transformer to measure the current on the coax cable. That type of current transformer can't tell the difference between current flow on the inside of the coax cable, and that on the outside. One way to find out if you have antenna currents flowing on the outside of the coax would be to wind up a bunch of turns of the coax on a toroid at the base of the antenna, and try your experiment again. If the reactance of the toroid choke is high enough the antenna current, flowing on the coax shield should be reduced to a small value. I had to do this with a 5/8 wl 2m magnet mount antenna, I use as a 1/4 wl antenna on 6m, to keep my mobile rig from reducing output power from a bad SWR reading, using the rig's internal SWR metering circuit. The clue was the changing SWR reading when moving the coax cable around inside of my van.

Show me where I'm wrong. Bzzzt. You can't do it.

Do you believe an impedance of 22.36 + j44.72 ohms will yield a 1:1 SWR?

OK. And when you find the impedance of that resonant circuit, what
is the imaginary component? That is, what is the number multiplied
by j?

By the way, that is not what you said. You said the "effective
impedance of a resonant circuit can be _any_ value."
You were talking circuit impedance; not L and C and R components.
The circuit impedance would be the sum of the L and C and R impedances.
To be resonant, there is only one value of the imaginary component of
this impedance; it must be zero.

> >> >3) Since it is resonant, can we not say that resonance is a

Hold on. You left something out. You ALSO said "which does not contain
any capacitive or inductive reactance." This is equivalent to saying
that the imaginary component of the impedance MUST be zero -- exactly
what you get with resonance.

So, in essense, you said a 1:1 SWR can only be achieved with a resonant
circuit. Remember, we are talking about antennas. Do you think the
antenna behaves exactly like a resistor? If I increase (or decrease)

the frequency, will the impedance stay at 50 ohms?

> >> I suspect you will now say that an antenna must resonate in order to
> >> be called an antenna. For Example #3, take a look at the antenna on a
> >> modern scanner that covers 30MHz to over 1GHz. That antenna is not
> >> resonant, and neither is the AM antenna attached to your car radio.
> >
> >An antenna need not be resonant. But, for a perfect match, it
> >must be resonant.
>
> . . . oh, brother. Read a goddam book!

Again, do you honestly believe an impedance of 22.36 + j44.72 ohms will
yield a 1:1 SWR?

> >Example #2 was inaccurate. Your definition of impedance is wrong.
>
> It is the same definition that has been used for over a hundred years.
> Did you change that, too?

No. You are calculating the magnitude of the impedance. This in NOT
what determines the SWR.

> >You do not understand that there is only one impedance, 50 + j0 ohms,
> >where the SWR is 1:1.
>
> Where is your reference? A Smith chart? That is only a tool to be used
> in combination with intelligence. If what you say is true, then there
> should be no need for 75 ohm coax, or even ladder line. Or baluns. Or
> any other type of antenna matching device.

Well, I am referring to a 50 ohm system which virtually all CBs are.
This is a CB Radio newsgroup, remember?

A Smith chart is normalized to the characteristic impedance of the
system. But a perfect antenna match ALWAYS requires a resonant load
impedance.

> >Example #1 was inaccurate. You have contradictory definitions of
> >resonance.
>
> There is nothing contradictory about the definition I used. It is the
> same definition that is used by EE's daily.

You think "22.36 + j44.72 ohms = 50 ohms"
No good EE believes this.

> >Example #3 proves nothing.
>
> Except that non-resonant antennas work.

Well, yes. But it proves nothing to support your argument.

> >Example #4 attributes a statement to me that I never made yet
> >still proves nothing.
>
> To you. But to a thinking, open-minded individual . . .
>
> >You're going to have to work harder, Sparky.

> afraid that you will find out that you are wrong about most of the BS
> you have been dishing out?

I have my facts straight. :-)

> I expected you to find some reason to welch on your offer. But I
> didn't expect such a lame excuse as "that proves nothing".

You were challenged to prove your case. You were citing some
facts that were irrelevant to your claims. I could say "2 + 2 = 4".
We all know its true but so what? It doesn't support our discussion
here.

> You are the
> only one here that continues to make claims that are in conflict with
> many, if not all authoritative references,

NOT!

> and you cannot provide
> anything to rebuke the claims of others.

I have provided some fundamental questions which you cannot or will not
answer.

> I don't know why you keep
> flapping your gums without any way to support your ideas, but until
> you do, many people here will consider you to be either a liar or just
> an ignorant troll. Your choice.
>
> Sparky, FLRC

Hee hee! Sparky, I am not the only one who has contradicted you here in
this newsgroup.

You think "22.36 + j44.72 ohms = 50 ohms"
And you think this impedance will yield a 1:1 SWR.

Let's take a vote and see how many on this newsgroup agree with you.
Let's hear it!

I vote that you are wrong.

I guess you couldn't read the relevant question: What is a vector?

>Do you believe an impedance of 22.36 + j44.72 ohms will yield a 1:1 SWR?

Yes. "Show me where I'm wrong. Bzzzt. You can't do it", because you
would be changing one of the fundamental principles of electronics
that has existed for decades.

>> An antenna is a load, just like any other load with reactance and/or
>> resistance. There is no electromagnetic property that makes an antenna
>> any different than any other reactance or resistance, because they all
>> have both to some extent.
>
>OK.

Therefore, it doesn't matter if your load is a non-reactive resistor
or a resonant antenna, or even a non-resonant antenna: if the
impedance is the same, you will get the same SWR. Hence, a
non-resonant 50 ohm resistor provides a 1:1 match, and satisfies your
$100 challenge.

>> That wasn't what I said. You can have an infinite number of values for
>> any LCR network that is resonant at a given frequency. THAT is what I
>> said.
>
>OK. And when you find the impedance of that resonant circuit, what
>is the imaginary component? That is, what is the number multiplied
>by j?

Zero. Have I said anything else? No.

>By the way, that is not what you said. You said the "effective
>impedance of a resonant circuit can be _any_ value."

It is no different except in construction.

>You were talking circuit impedance; not L and C and R components.
>The circuit impedance would be the sum of the L and C and R impedances.

That's what a resonant circuit is made of, you dope! The impedance of an ac circuit is found by the equation I gave earlier, where R is the net resistance and X is the net reactance. This is called "rectangular notation", it is a vector quantity, and it works the same way it has worked since it was first contrived. Maybe your hangup is that you haven't considered that an LCR circuit can be operated outside of resonance. It will then have reactance, regardless of the fact that it is resonant at another frequency. Even within the circuit's bandwidth there will be reactance when not on it's center frequency.

I might add that this is why the SWR changes along the bandwidth.

>To be resonant, there is only one value of the imaginary component of
>this impedance; it must be zero.

No problem.

>> Let me paraphrase for myself: "A 1:1 SWR _can_ be achieved with only a
>> resistive component . . ." Don't substitute my words for yours.
>
>Hold on. You left something out. You ALSO said "which does not contain
>any capacitive or inductive reactance." This is equivalent to saying
>that the imaginary component of the impedance MUST be zero -- exactly
>what you get with resonance.

Ok. I'll rewrite this for a fourth-grade reading level: A 1:1 SWR can be achieved with just a resistor. It can also be achieved with a combination of resistance and reactance, or even just reactance. The resistor has no (practical) capacitive or inductive reactance. Therefore, the resistor is not resonant. I have satisfied the requirements of your challenge.

>So, in essense, you said a 1:1 SWR can only be achieved with a resonant
>circuit.

There you go sticking words where they don't belong. I never said, "can _only_ be achieved". You added words again.

> Remember, we are talking about antennas.

We are talking about the load at the end of a transmission line.

> Do you think the
>antenna behaves exactly like a resistor?

No. And that wasn't your question.

> If I increase (or decrease)
>the frequency, will the impedance stay at 50 ohms?

In an LCR circuit, no. In a purely resistive circuit, yes. That's the difference between an antenna and a resistor. Duh . . .

>> >Example #2 was inaccurate. Your definition of impedance is wrong.
>>
>> It is the same definition that has been used for over a hundred years.

>> Did you change that, too?
>
>No. You are calculating the magnitude of the impedance. This in NOT
>what determines the SWR.

To quote your challenge:
>If it is not resonant, then it is not 50 ohms.
>Give just one example to show how to do this.
>I'll give you $100 if you can.
In consideration of that, I think the generally accepted definition of
impedance is very relavent, and that is what I have used.

>> >You do not understand that there is only one impedance, 50 + j0 ohms,
>> >where the SWR is 1:1.
>>
>> Where is your reference? A Smith chart? That is only a tool to be used
>> in combination with intelligence. If what you say is true, then there
>> should be no need for 75 ohm coax, or even ladder line. Or baluns. Or
>> any other type of antenna matching device.
>
>Well, I am referring to a 50 ohm system which virtually all CBs are.
>This is a CB Radio newsgroup, remember?

Please correct this if incorrect, but this is your argument: There is
only one impedance, 50 + j0 ohms, where the SWR is 1:1 because this is
a CB newsgroup, and virtually all CBs use a 50 ohm system.

>A Smith chart is normalized to the characteristic impedance of the
>system. But a perfect antenna match ALWAYS requires a resonant load
>impedance.

I don't like the word "perfect". The most efficient match is the one
that transfers the most power from the source into the load. Resonance
is not required. The most efficient antenna is the one that transfers
the most power delivered to it into space. A resonant antenna is very
efficient, but not necessarily the most efficient.

Again I will add that a hertzian dipole, a resonant antenna, has a
small amount of inductive reactance.

This again satifies your criteria.

>> >Example #1 was inaccurate. You have contradictory definitions of
>> >resonance.
>>
>> There is nothing contradictory about the definition I used. It is the
>> same definition that is used by EE's daily.
>
>You think "22.36 + j44.72 ohms = 50 ohms"
>No good EE believes this.

I would like to see you qualify that.

>> >Example #3 proves nothing.
>>
>> Except that non-resonant antennas work.
>
>Well, yes. But it proves nothing to support your argument.

It does, as I just stated. However, it was not to support my argument, but to provide the example you wanted. Since you agree with it, it has done so.

>I have my facts straight. :-)

You say so, so it must be true. Profound. An undeniable reference. Undeniable, that is, to yourself. Another reason why you won't read a book?

>> I expected you to find some reason to welch on your offer. But I
>> didn't expect such a lame excuse as "that proves nothing".
>
>You were challenged to prove your case.

I did. It is not my fault that you can't understand the answers.

>> You are the
>> only one here that continues to make claims that are in conflict with
>> many, if not all authoritative references,
>
>NOT!

Powerful argument . . .

>Hee hee! Sparky, I am not the only one who has contradicted you here in
>this newsgroup.
>
>You think "22.36 + j44.72 ohms = 50 ohms"
>And you think this impedance will yield a 1:1 SWR.
>
>Let's take a vote and see how many on this newsgroup agree with you.
>Let's hear it!
>
>I vote that you are wrong.

Sure, like the majority is never wrong. Better yet, why don't you put up some more money for someone to prove me wrong? That will go over great after welching on your other offer. Even better, why don't _you_ prove me wrong? I think the best option is for you to read a book and learn something about the subject.

I just purchased a little Cobra 25 NW ST, and I have to say, this Nightwatch feature is the best advance in CB radio in 30 years. (actually, there is not much you can do, legally, do a cb radio to improve it). The soundtracker feature actually does work, and the visibility of the faceplate of the radio is simply stunning. Not only is is pretty, it's
dead-on readable in lowlight to dark conditions.
Check it out if you get the chance.

You could also use the Uniden Grant mobile rig with a power supply, it's an
excellent radio as well.
As for the I-max 2000 antenna, it is excellent.
It is also somewhat of a large antenna. If space is
a consideration, the standard Antron 99 with optional radial kit is a very
good performing antenna. Without the radial kit, it's a simple 18 foot
fiberglass rod. I've had one up for 4 years, and it
handles tornado season in Alabama with aplomb.

Or stay with a clean amp that has bias on it.

Texas Star, some Palomars and Messenger are some of the cleaner amps on the market today.

I have an 11 year old Cobra 2000 which has served me well. The receive
has been falling off for a long time. I suspect a leakage in the RF amp but
haven't took time to check it yet. Guess what I am asking is has anyone else
experienced this with a 2000 and came up with the problem? I first thought
it was antenna trouble but my Rad Shack 465 has all kinds of ears.
Thanks
Gary

Personally, you need to check the channel switch.

If that comes out OK, then you need to check the input to the binary adders.

If that is OK, then you have a PLL problem, or in rare cases, VCO.

If you can't figure out how to check the truth tables of the channel selector, you have absolutely NO business inside that radio.

bzzzttttt

> >
> > If they want to make people happy, provide customer service.>
> ==========
> they must provide just enough customer service since i hear hundereds and
> hundreds of them across the band

No, they provided a product that someone on this newsgroup pushed when
Texas Star was not building amps during the bust in the mid 90s.

Go out to the west coast in the mid 90s, and not a fucking sole heard of
DaveMade, unless
they where into keydowns and / or on the internet. Simple fact of life.

> >
>
> > DaveMade and their cronies have been pushing that line of shit for so

> ==========
> davemades are not for the average guy they are not for ssber they are not
> for truckers, they are not for the rookie operator,

You claim something different than what the DaveMade promotional bullshit
spews then.

Seems I can order a DaveMade (if it ever arrives) with SSB.

Wrong on point 1.

And they have been pushed by the retailers to EVERY CLASS OF OPERATOR.

If that ISN'T what their intended use was, then the manufacturer is at fault
for NOT
pulling in the reigns and shutting the supply off to the truck driver.

Sony does the same shit with their playstations at Christmas time.

Create a demand (they have that because they do make a decent box), then
don't make enough to
go around.

BAMM

All of a sudden, the falsely made lack of supply increases the price. Not
rocket science.

can they use them there
> yes, but his business was all about competition thats his market you guys
> have made him out to be a supplier of everyone have any of you ever heard
> dave himself say anything post anything No i dont think he would
> what is wrong with that

And what the fuck does your last comment have to do with this conversation?

> they are davemades major sellers the 3 pills and 5 pills and if they
plunnk
> down there hard earned cash it will be cheaper than a comparable amp on
the
> market

So is Texas Star.

I would like to compare actual units sold of the DaveMade line to something
like the Texas Star..

Dave wouldn't even compare.

>
>
> >
> > It comes from Dennis and the rest, who are busy building amps and NOT
> > providing answers to the questions.
> ==========
> perhaps they have reasons for not answering every question posed to them
> maybe some are a waste of time where as a davemade is not for them,

And because someone writes and asks, "How many watts will my box do at 21
volts

with this much drive" they are automatcially assumed an idiot, and not
worthy to run
a DaveMade.

Give it up. It is assinine, the lack of support that band of builders
provides.

maybe
> they only want to deal with people they know or feel comfortable with,
> remeber amplifiers are still illegal. you can run your business how you
> want and i guess they do the same.

And they lost market share, and XForce gained.

What does that tell you?

>
> >
> > Gee, X-Force has a good name, and a reputation for customer service.
> > So, I guess, a manufacturer can provide both, huh?
> ==========
> the good name came from daves design they provided the rest.
>
> >

So, I guess "The Design" wasn't enuff, was it.

And Dave stole that from Helge Granberg.

So he is no better than Danny, is he?

>
>
> > Thats great.
> > I guess these guys where born knowing all this information, too, huh?
> ----------==========
> no they learn it just like you do or they try it themselves .

Oh, by asking questions, and playin with their stuff?

Wait.. They COULDN'T have learned it like me, since you guys don't HAVE to
answer any questions, and REFUSE to sell to someone who HAS to ask.

>
> >
> > Some people are so fucking narrow minded it makes me sick.

an
> engine for his work car... uhh get the connection why should a trucker or
a
> guy who wants a ssb amp go to a guy who builds competition amps

And why should someone who is wanting to step up to the battle box amps have
to
put up with the bullshit that asshole put out?

They shouldn't.

I can go to any engine builder here in town and tell him what I want, and he
will answer my
questions.

Thats called Customer Service.

Again, they don't provide it, because they are elitist.

> >
> > Its called CUSTOMER SERVICE.
> >
> >
> > Your now going to equate DaveMade to Nascar? Highly doubtful.
> ==========
> You are a moron he was saying why would a average person go to a

Davey woke up one day, and said "I will ground the base of the
transistors"... This will turn them off for a greater amount of time.

Then I will reduce the collector to collector capacitance. This will keep
the runaway current problem under control.

Wait.. Helge Granberg figured that out in the 60s.

Social Security application
A retired gentlemen went into the social security office to apply for Social Security. After waiting in line a long time he got to the counter.=A0 The woman behind the counter asked him for his drivers license to verify his age. He looked in his pockets and realized he had left his wallet at home. He told the woman that he was very sorry but he seemed to have left his wallet at home. "Will I have to go home and come back now?" he asks. The woman says, "Unbutton your shirt." So he opens his shirt revealing lots of curly silver hair. She says, "That silver hair on your chest is proof enough for me," and she processed his Social Security application. When he gets home, the man excitedly tells his wife about his experience at the Social Security office. She said, "You should have dropped your pants, you might have qualified for disability, too."

Sure they can inspect your station, with your permission. But, they need
a warrant to force that inspection. Of course, if you refuse, then you will
probably be hit with a fine (and maybe a warrant served by a Federal Marshal).

To verify this, just take a look at the FCC actions against several radio
amateurs recently. They refused inspection, and have been hit with fines
and (if I recall correctly) loss of license in at least one case.

TH, Yeah, but I did read somewhere that this wasn't supposed to allow cops (whoever they may be working for) to lay in wait or "stalk" truckers over their radios. Not to say that couldn't change, tho. There is the 10 meter issue that *could* cause something like that to happen. I mean, the people up in Wisconsin and Michigan got the HR2346 thing going, and if hams start griping about trucks up in 10 meters, who knows? Any-hoo, they can't do much with them now the way it is written. I wouldn't be surprised if some jurisdiction *tried* it IF there could/should/would be money in the deal!

Sparky, there is no need arguing with someone who does not understand the most rudimentary basics. You have pointed out the correct formula for impedance, he refuses to buy it as fact. He operates under his own set of electrical laws and neither you nor I have a chance of getting anywhere in an attempt to educate him.

He has never understood the basic fact that a shorted 1/4 is seen as an open or infinite Z and that a shorted 1/2 wave is seen as a short or 0 Z. It would stand to reason that any impedance can be derived between these two values regardless of the value of the coax.

He refuses to see that the resultant vector is by definition the impedance and the angle of the vector the phase angle.

Very true. I have no intention of educating him. As far as I'm
concerned he is beyond hope and reason. But it allows an excellent
opportunity to clear up misconceptions that people like him propogate.
I do agree, however, that it has gone beyond the scope of most CB
enthusiasts.

He refuses to read the facts for himself. He refuses to admit when he
is wrong. He refuses to make good on his $100 challenge. He is a liar,
a welcher and a troll. His words are no longer any good here and will
be ignored.

Cecil (if you want him directly, go up to rec.radio.amateur.policy) is a retired engineer for Texas Instruments and a pretty knowledgeable soul.

The purpose of the switchable lengths of ladder line is to make the coax-to-openwire transition at a current node, not to vary the SWR on the ladder line.

In this discussion, no one has pointed out the obvious difference between installations of this kind and the classic CB mobile: there is some sort of tuning or isolation mechanism between the transmitter and the antenna feed. In this case it is a shitpot of ferrite chokes in addition to what amounts to a tuning mechanism. The transmitter finals are not subjected to amazing reverse voltages nor is it expected to iron out reactances. It allows power reflected from the load to simply be reflected back to the load. The SWR on the ladder line can get to be pretty phenomenal with not a lot of loss.

This is not a particularly new stunt. It is often necessary to adjust feedline length to keep the values of current and voltage in a tuner within manageable bounds. In the pre-coax days, balanced feedlines were often used with link coupling or some other form of tuned, balanced output. This one adapts an old idea to the reality of modern transceivers.

At the risk of sounding like a broken record, multi-band operation is the major difference between Amateur and CB practices.

Great explanation and I see where you are coming from, but having a license would give you a advantage because the new law exempts Hams from the being bothered by local police. Unless like some have mentioned, the local police cant differentiate between a CBer and a Ham and continue with citation till court clears up the matter.

Skip doesn't roll in. Skip refers to the distance ("skip zone") that
a skywave signal misses (skips over) from the point that it leaves
Earth to the point that it returns after being refracted from the
ionosphere:

ionosphere
/\
/ \
/ \
/ \
* *
xmtr rcvr

<---skip zone--->

A W6 might be in QSO with a W1, yet a W0 in between might not hear either
side of the QSO due to being in the skip zone.

On VHF, the best distance one can expect to get is line of sight,
whether he uses 1w or 100w.

I would beg to differ with you on one point my friend, there are allot of CBers that you call low lives that simply don't agree with the present 4 watt/ no skip rule and choose to break the law yes. Does this make them a low life? No. They just have made the conscious choice to operate beyond what the regs allow. There are plenty of ops that run there stations as good and if not better then Ham operators, fact. They have taken all the normal necessary steps to prevent TVI as any Ham would do so.

My point is there are people since the beginning of time who challenge law and have changed law through defiance. These people are pioneers for the future. Whether you see them as low life or not I am sorry. Sometimes simple logic and the power of reason dictates a persons mind, and in effect he does what he feels is exceptable as long as it isn't at the expense of others.

Now you will reply, "well there are bands allocated for that kind of broadcasting already". Well the problem with that is WE don't want to be part of that group because of what it represents. So my friend perhaps you should ask your self why is it that your organization doesn't appeal to the mass population that chooses to stay in there present band? Why? Lazy? please... there practically giving out tech licenses for free. Times are a changin and there will be a attempt to stop the Will of the populace for a season but, as with any laws that is made in vain and with out Reason, it shall fall.

peace.

VHF? Line of sight? Don't believe that one. Tropospheric effects are comming into play at this frequency, sporadic E propogation exists, and at the 100 watt level, you're looking at 2,000 mile distances (although not often). Hmm ..

Why is this suddenly cross posted? Up until now, this thread was only on RRAM. Is this like trolling? You all can't stir up enough shit? Just because some hammie says "CB" in a post, we have to see it? 16 posts before this one were only seen on RRAM. What's wrong Jeff, bored in paradise? I've been to Honolulu. I've seen the roving bands of native Hawaiians on mopeds. I rode a moped around Diamond Head. A major city in paradise is still a major city. I preferred the Big Island and Maui over Honolulu even if I was only a stone's throw away from Pearl Harbor and Wikiki. Well happy holidays anyway.

Fred Hambrecht,
What you're trying to describe is called a conjugate match,
and will not 'work' as you tried to explain. I have no interest
in fooling an SWR meter, would rather match impedances and gain
the power wasted in fooling the SWR meter. By the way, that
18 feet isn't anywhere close to an electrical 1/2 wave length.

Sparky,
Hate to tell you this, but you're wrong, all the way through. Theory is just as important as empirical data, they are inter-dependant. All 'conjugate' matching is done with at least two feedlines of differing characteristic impedances. Can't do it any other way. If what you are saying is true, there are lots of people in the radio 'biz' doing it wrong, and earning a very nice living! Your wrong, give it up.

Handy Andy,
Don't worry about connecting the dots. You might
check those 'dots' to see how many of them are 'fly-
specks', and not really 'dots' (or maybe they're chads?).
Seriously, Andy, your misconstruing the results of
inaccurate empirical testing (experience) and then trying
to justify your conclusions using theory that you do not
understand.

Exactly! And, if you express resonance by writing "50 ohms"
you are actually saying "50-0j, or 50+0j", correct? And
by using your definition, 50 ohms ~is~ expressing resonance,
there is no imaginary component.

Galaxies...saturns....they are all pieces of JUNK! They are flimsy replicas of a CB radio that can operate on unauthorized frequencies. They are high priced pieces of junk and can be easily sold to FOOLS like you. take the cover off one and take the cover off a REAL radio like an ICOM or KENWOOD. compare the innards.....not to mention the cavalcade of CRETINS who call themselves "TECHNICIANS" who botch up many a radio. I was into CB about 12 years ago and apparently the mentality hasnt changed one bit. I sold out and became a HAM and have REAL RADIOS. most cb'ers are running around like chickens with their heads cut off scrambling to decipher the mystery of what radio to get, what antenna to get, where is a good "technician".....well at least here in rhode island, the cb craze has mostly died down. you tune across the cb band and usually dont hear anybody like in 1987. there were big mouth, high powered cb'ers all over the dial. now you are lucky if you hear 2 grannies chatting. the fcc busted alot of them and they never returned and many became HAMS. which is good i guess if you were experiencing TVI problems. anyway....trash the TOY radios and get with the program.

Greetings!

Sorry Doc, no sense in wasting any more time in this thread. I'm having a good chuckle at the banter that is going on.

Quite frankly - someone, and it's certainly not me [judged by the anal orfice you spewed out below] made this whole thread a lot more complex than any coax could ever acheive.

I'm really enjoying this. I like to see people get beat up like you're getting out on this thread. I hope you're enjoying this too! ;-)

No one wins in these debates, all have valid points. You simply are no longer qualified if you post the carp like below.

Maybe it is something you should have excerised before posting this...

On Tue, 19 Dec 2000 02:04:57 -0600, while the modem was ice fishing with the Mouse, 'Doc <w5lz@oio.net> dissertated the following:

:+> Confusius say; "Grasp left ottic appendage firmly between

I agree. Only a crackpot would create a theory that disputes the
empirical data. Only a putz refuses to provide evidentiary support for
his theory (or his warped interpretation of existing theory).

> All 'conjugate' matching is done with at least two
>feedlines of differing characteristic impedances.

Conjugate matching is done with differing impedances, however two
feedlines are not always required. Ever hear of a delta-feed?

Greetings!

Well, the extension needs to be set so that the coil is above the roofline. Higher clearance the better. [Thinking that you're using a mirror mount with a Wilson? Roof made of fiberglass? Is their a foil shield underneath all the headliner trim? Hows the antenna mounted now?]

Extension? The long shaft that allows the coil to be at different heights from the mount.

Not sure of your set-up [Duals? Roof Mount? Reefer mount?] - but I'm thinking you're going to need at least a 12" shaft on those mirror brackets. The coil base should at least clear the roofline. Some makers offer a shaft to extend their coils to 31" high. But, you'll need to shorten the stinger [top whip] because the extra height the lower shaft adds, changes the tuning length of the antenna.

The trailer is going to add to this too.

Not sure if the above stuff is going to help, but I do have questions for ya' if you can answer them, we may be able to nail down something that'll work.

He is using 450 ohm transmission line as an impedance transformer to match to 50 ohms. That CAN be done.

You CANNOT use a 50 ohm transmission line to match to a 50 ohm system. This is what we are talking about. You can cut your 50 ohm coax all you want, the SWR will not change.

By the way, note that his graphic shows his 450 ohm matching system matching to a 50 ohm transmission line which can be "Any Length" (his words).

Yours is another example of an accurate presentation taken out of context to inaccurately support the claims.

I know. I don't care if one person believes it. I just hate
it when they perpetuate these myths and old wives' tales and
try to get others to believe it. Those web sites are a disgrace.
Those Firestik guys should defend their claims or take them down.
I tried once to get them to do it but they wouldn't -- and couldn't.

By the way, have you noticed that no one has challenged my points
describing the problems on those sites? Furthermore, no one has ever
been able to challenge my calculations when I show how coax length
does not affect SWR. But they keep rambling. They say they have "seen
it" but can't reconcile their misconclusions with theory. Then, they
ridicule the theory (after they have even quoted some). They can't show
that I am wrong but it doesn't stop the namecalling. They tout
their degrees and licenses but can't answer a few questions
challenging their claims.

It is as you said -- shooting fish in a barrel. I just want others
to see.

They already have. It's called "go to the next hamfest and buy a used dualband handheld that's been modded for extended TX coverage." For slightly more $$$ than a high-end Motorola Talkabout, they now have 5 watts & external antenna capability on both FRS and MURS.

> > I'll give you $100 if you can.

Fred, you are changing the subject. I know you're getting a little
uncomfortable in your indefensible position. But that's OK. I will
address the original subject and your new changed subject.

The original subject is whether or not a 50 ohm antenna is resonant.

You say "resonance, is defined as the condition where XL=XC..."
That much is correct. And, when XL=XC, there is no imaginary term
in the impedance. The impedance is R + j0.

50 ohms is 50 + j0 ohms. It is resonant. Period. End of story.

And, since 50 ohms is a requirement for a 1:1 SWR, resonance is
also a requirement for a 1:1 SWR. If you do not have resonance,
you do not have 50 ohms and you cannot have a 1:1 SWR.

Now to your changed subject:
Yes, there are 50 ohm antennas. You guys who keep quoting your 72 ohm
dipoles and 37 ohm ground planes are referring to ideal antennas as
studied in most texts. That makes sense; you want to minimize the
number of variables when approaching a new topic in a text book.

However, the reality is that there are other variables which affect
antenna impedance. The most notable is probably the diameter of the
elements. As this diameter is increased from the ideal and unreal
infinitely thin element in your text to the real and common width
found in actually realized antennas, the impedance changes and the
antenna becomes more broadbanded. Many of the heavier-duty antenna
books show plots of impedance versus element diameter and many of
the impedances clearly pass through 50 ohms.

I think you will find many CBers who disagree with your premise which, in effect, states that a 1:1 SWR in unachievable on an antenna without a matching network.

By the way, Fred, you never answered my question on how you match a 37 ohm load with 50 ohm transmission line. Answer the question or concede that you are wrong. Hint: you are wrong.

That's the part I object to. The cops, for the most part, aren't going to know the difference between a legal CB radio, an amp from a power supply, a ham from a CBer. It might be rare, but *somebody's* gonna run into the rambo "I-am-the-law-boy" type who THINKS he knows everything, and like you said, the radio op will end up taking time off from work and going to court just to prove his innocence. The ham will end up having his case thrown out for lack of jurisdiction, but what about the CBer who is innocent? AAAAHHH! WE can hope that *most* local law doesn't even get involved. They may not. I hope not.

Jerry

The definition of "commercial Carrier" has been defined by the law and
it states
that there must be "probable Cause" to stop a trucker which means that
Officer Friendly must "observe" the violation. This is to prevent
LEOs from going on a fishing trip by stopping all trucks with
an antenna.

BTW

Has any local jurisdictions passed any Laws yet?

What is relevant about it?

OK, I'll tell you. A vector is an expression of both magnitude and
direction.

Now you tell me what this equation of yours means:
Z = (R<illegible> + X<illegible>)^<illegible>
Identify all the variables and their meanings.

> > >Do you believe an impedance of 22.36 + j44.72 ohms will yield a 1:1 SWR?

> > would be changing one of the fundamental principles of electronics
> > that has existed for decades.

Plot that impedance on the Smith Chart.
Is it in the middle?
No.
Is there a non-zero reflection coefficient corresponding to that point?
Yes.
What is the reflection coefficient if the SWR is 1:1?
Zero.
Since your reflection coefficient is not zero, can the SWR be 1:1?
No.

Sparky, try to show me what is wrong with the preceding sequence of
logic.

> >> An antenna is a load, just like any other load with reactance and/or

We were talking about antennas. You cannot find an antenna impedance
that is non-resonant and yet still yields a 1:1 SWR. Admit it.
You failed.

> >> That wasn't what I said. You can have an infinite number of values for
> >> any LCR network that is resonant at a given frequency. THAT is what I

> >by j?
>
> Zero. Have I said anything else? No.

OK. But you did say that, for a 1:1 SWR, the impedance need not
be resonant. I was trying to determine if you misunderstood resonance
or misunderstood SWR. I will accept that you understand resonance.
I see now that it is the SWR part you do not understand. I'll wait to
see your response to my sequence up above.

> >By the way, that is not what you said. You said the "effective
> >impedance of a resonant circuit can be _any_ value."
>
> It is no different except in construction.

If the imaginary component MUST be zero, as you now agree, the effective
impedance of a resonant circuit cannot be _any_ value, can it?
It can only be _any_ value where the imaginary component is zero.

> >You were talking circuit impedance; not L and C and R components.
> >The circuit impedance would be the sum of the L and C and R impedances.
>
> That's what a resonant circuit is made of, you dope!

No kidding. But, as I said, we were talking about impedances which
consist of a real part and an imaginary part. We were not directly
discussing L and C and R values.

> The impedance of
> an ac circuit is found by the equation I gave earlier, where R is the
> net resistance and X is the net reactance.

Yes, but what is:
Z = (R<illegible> + X<illegible>)^<illegible>

The correct equation is:
Z = R + jX

> This is called "rectangular
> notation", it is a vector quantity, and it works the same way it has
> worked since it was first contrived.

My correct equation is in rectangular coordinates also known as
a Cartesian plane.

No argument here (except for who has the hangup).

> I might add that this is why the SWR changes along the bandwidth.

Agreed.

> combination of resistance and reactance, or even just reactance. The
> resistor has no (practical) capacitive or inductive reactance.
> Therefore, the resistor is not resonant. I have satisfied the
> requirements of your challenge.

Again, we are not talking about resistors. And let's analyze what
this fourth-grader wrote:
"[A 1:1 SWR] can also be achieved with a combination of resistance and
reactance, or even just reactance."

So, you are saying a 1:1 SWR can be achieved with JUST REACTANCE.
Give me the impedance of a circuit with JUST REACTANCE that will
yield an SWR of 1:1.

> To quote your challenge:
> >If it is not resonant, then it is not 50 ohms.

> >I'll give you $100 if you can.
> In consideration of that, I think the generally accepted definition of
> impedance is very relavent, and that is what I have used.

It depends on what the definition of "it" is. :-D
"IT" is what we have been talking about -- AN ANTENNA!
Stop using words out of context.

> Please correct this if incorrect, but this is your argument: There is
> only one impedance, 50 + j0 ohms, where the SWR is 1:1 because this is
> a CB newsgroup, and virtually all CBs use a 50 ohm system.

Let me reword it.

For the context of this CB newsgroup discussion, we should only concern
ourselves with the virtually universal system impedance of 50 ohms.
My argument is that, at that system impedance, there is only one antenna
impedance, 50 + j0 ohms, that provides a 1:1 SWR. Since that impedance
is resonant, resonance is a REQUIREMENT for a 1:1 SWR.

> >A Smith chart is normalized to the characteristic impedance of the
> >system. But a perfect antenna match ALWAYS requires a resonant load
> >impedance.
>
> I don't like the word "perfect". The most efficient match is the one
> that transfers the most power from the source into the load. Resonance
> is not required. The most efficient antenna is the one that transfers
> the most power delivered to it into space. A resonant antenna is very
> efficient, but not necessarily the most efficient.

BUT, for the virtually universal CB radio system impedance of 50 ohms,
my statement is total fact. Again, this is a CB radio newsgroup.
Many hams seem to forget this. They pull out examples of ladder lines
and hardware that virtually no CBer uses.

> >You think "22.36 + j44.72 ohms = 50 ohms"
> >No good EE believes this.
>
> I would like to see you qualify that.

No qualifier is needed. No good EE believes that.
It is nonsense. Quote us a reference.

> >You think "22.36 + j44.72 ohms = 50 ohms"

An eloquent rational such as yours, makes no more of a case for breaking the law than the profane one normally offered. I personally have a problem with the "I am going to do my own thing" attitude, like it is some god given right to break the law because you want to.

Setting forth all the rational thoughts, excuses, and justifications for breaking the law amounts to nothing!

You have two choices, get the law changed or get in a radio service that permits the types of operation you choose to engage in. The first is unlikely, and you have obviated the second. Ergo you are a law breaker, simple as that. Now you can get upset for me pointing out the facts, but! it changes nothing. How does one explain to their children that only some rules apply some of the time?

>Haven't been on the bands for very long, have you Sonny?

Almost 25 years.

See Page 17 of the ARRL Antenna Book (Tenth Edition) for an
explanation of "skip zone" -- the region on the earth that
a sky wave skips. My diagram above comes from that page.

Apparently you, too, misunderstand that term.

>>On VHF, the best distance one can expect to get is line of sight,
>>whether he uses 1w or 100w.

>Somebody want to explain ducting to this old boy?

Tropo ducting is not a normal day-to-day phenomenon. I'm surprised
you don't know that.

>jeffreyh@Hawaii.Edu (Jeffrey Herman) wrote:

>>Skip doesn't roll in. Skip refers to the distance ("skip zone")

>Haven't been on the bands for very long, have you Sonny?

It's really funny to think that someone of your supposed
qualifications doesn't understand "skip zone" as outlined
in the ARRL Antenna Book. The term doesn't not refer to
the "skipping" of radio waves across the sky! Radio waves
do not "skip" -- they only refract when passing from one
medium to another -- just like light.

To assist you in understanding what's apparently a new meaning
to you for an old term, here's a tutorial from the League's
Antenna Book, Page 17, 10th Ed.:

"...For some distance, then, depending on the critical angle,
there is a region about the transmitter where the sky-wave
signal will not be heard. This "silent" region, extending
from the limit of the useful ground wave to the distant point
where the sky-wave signal can first be heard, is called the
skip zone, because all signals skip over it. The skip zone
is indicated by the skip distance in Fig. 1-8."

Here's a sketch of that Figure 1-8:

ionosphere
/\
/ \
/ \
/ \
* *
xmtr rcvr

<---skip distance--->

>Jim Weir, VP Eng. RST Eng. WX6RST

...but who doesn't know what "skip zone" means. That pretty much
distroys any credibility you have on here.

Scott (Unit 69 Chesapeake Bay) <upplus@hotmail.com> wrote:
>Why is this suddenly cross posted? Up until now, this thread was only
>on RRAM.

Because this sub-thread is purely about the definition of "skip,"
one of the most misused terms on ALL the bands. Even a supposedly
long-time licensed amateur like Jim Weir doesn't understand it.

>Is this like trolling?

What's "like" trolling? How does one troll for "like"? (Isn't "like"
an irregular verb?)

>You all can't stir up enough shit? Just because some hammie says
>"CB" in a post, we have to see it? 16 posts before this one were only
>seen on RRAM.

This is what's called a sub-thread -- I even re-named the subject
line to calm you down. Now do you have any comments regarding the
context of what I wrote (see below)?

>What's wrong Jeff, bored in paradise? I've been to Honolulu. I've seen
>the roving bands of native Hawaiians on mopeds.

The only native Hawaiians left are living on Niihau; only a very small
handful on Oahu. What you saw were other tourists like yourself:

>I rode a moped around Diamond Head.

...creating a traffic dilemma for the rest of us. Honolulu is the
tenth largest city in the country with all the traffic nightmares
that accompany that ranking, and the tourists weave their 15 mph
mo-peds from lane to lane, running stop signs and signal lights.
Next time you visit, please rent a bicycle, instead!

That's great, Hans. Tell us the ASL elevations of the antennas.
Line-of-sight between two points can certainly reach 150 miles,
as you can prove to yourself using our old friend D = 1.41*sqrt(H).
And let's not forget special circumstances such as knife-edge
refraction. But what works for you is not a given normal situation
for everyone else. (Are you telling us that everyone can expect
to transmit 150 miles on a MUR stubby antenna?)

Now just to be sure, why not provide the callsigns of these "friends"
so we can confirm these QSOs?

You all have missed the key word, "expect," in my statement above. VHF propagation anomalies exist, such as knife-edge refraction when a mountain peak is between the two stations, tropospheric refraction during a temperature inversion, tropospheric ducting in the tropics and over large bodies of water, sporadic E (unpredictable and short-lived, and occurs 1/10 as often on 2m as on 6m), Auroral, Auroral E (rare at 2m), and meteor scatter.

Can one "expect" any or all these phenomenon to consistently exist on a day-to-day basis? Of course not. Let me quote from the ARRL VHF Manual: "Radio waves travel in straight lines unless forced to do otherwise. In some respects, VHF waves are less easily reflected than waves of lower frequency, so consistent VHF communication with low power tends to be essentially local in character, covering only slightly more than line-of-sight distances."

"or get in a radio service that permits the types of operation you choose to engage in."
This is the crux of much of the debate. The Ham community trying to bolster their ranks wit the CB operators
many capable CB operators who have chosen NOT to succumb to the beuacracy and stodgy out dated rules and regulations. Fred if you wish your beloved radio service to continue then all you hams had better petition for the new laws and regs the would seduce the CB community to your ranks. Like labor unions no members no strength.

As far as breaking the law it is just another form of speeding, illegal parking, J walking and thousands of other basically unenforceable laws on the books. So that argument is falling on deaf ears If you haven't noticed.

Some of you Ham operators are up in arms over 10 meter now that the skip cycle is peaking. 2 years from now there will be no interest. So you have a wasted band that could be utilized to free up some air space for the CB community.
Radio regs should be changed to allow 100 watt radios. This would spawn a whole new stimulus to the Cb radio manufacturers. Better quality radios would be developed as well as related equipment. Quality manufacturers like Uniden, Kenwood etc would rush to the opportunity to develop legal 10/11 meter radios for CB use. They realize that there is no interest in 4 watt radios they are inadequate today. And if they can't get a modifiable radio type accepted there is no money it. So they continue to build the old chassis by the thousands so the techs can soup them up and provide their users with a functional radio. In the mean time sub par radios pour in from China, Taiwan etc. under the guise of 10 meter amateur radios or export only designs.

Would this stop higher power amp use? probably not. But a large percentage of users would find the 100 watt capable radio with improved receivers and user friendly state of the art electronics all they would need. Most of those dirty little 1 and 2 pill would fade away as well as many of the poorly modified, ripped and clipped radios.

If you want to preserve Ham radio you better find a solution in putting your arms around the CBing public and providing some stimulus to those 10/11 meter bands. Bills like the one just passed are not a solution it is inflammatory and could cause some serious harm to those concerned ham operators that want to assist in the local authorities enforcement.

It is not 'my' equation. The fact that you don't know what it is
indicates that you still have much to learn on this topic . . .

>Identify all the variables and their meanings.

. . . and that you ignore other's posts.

>> >> An antenna is a load, just like any other load with reactance and/or
>> >> resistance. There is no electromagnetic property that makes an antenna

You contradicted yourself, and I am tired of repeating myself.

>I see now that it is the SWR part you do not understand. I'll wait to
>see your response to my sequence up above.

SWR = Vmax/Vmin or = Imax/Imin.

>If the imaginary component MUST be zero, as you now agree, the effective
>impedance of a resonant circuit cannot be _any_ value, can it?
>It can only be _any_ value where the imaginary component is zero.

Fine. What's your point? That because a resonant circuit has no
reactance, then a non-reactive circuit must be resonant? Have you ever
heard the phrase, "positing the consequent"?

>> >You were talking circuit impedance; not L and C and R components.
>> >The circuit impedance would be the sum of the L and C and R impedances.
>>
>> That's what a resonant circuit is made of, you dope!
>
>No kidding. But, as I said, we were talking about impedances which
>consist of a real part and an imaginary part. We were not directly
>discussing L and C and R values.

Then what were we discussing? Antennas? Antennas have all three components, and that is what makes them work in an AC circuit. And the combination of the three is what comprises the circuit's impedance. What's the problem here?

>Yes, but what is:
> Z = (R² + X²)^²

They are equivalent, and you would know that if you actually studied the topic. Try studying a bit of math,too, especially the chapter on complex numbers.

>> >> Let me paraphrase for myself: "A 1:1 SWR _can_ be achieved with only a
>> >> resistive component . . ." Don't substitute my words for yours.
>
>You said it "therefore cannot be resonant." Stop snipping out what you
>wrote.

Let's read what I wrote:
>No, since it is not resonant. A 1:1 SWR can be achieved with only a
>resistive component, which does not contain any capacitive or
>inductive reactance, and therefore cannot be resonant.
A resistor has no (practical) capacitive or inductive reactance, so it can't be considered to be resonant. A resistor can provide a 1:1 SWR. Seems pretty clear to me, that is, as long as you go back and read the whole thing instead of pulling select phrases to suit your argument.

>Again, we are not talking about resistors.

No, _you_ are not talking about resistors because to do so would be to admit that you are wrong. I am talking about a load with an impedance. But if you want an example of an antenna, take the example where the antenna impedance equals 22.36 + j44.72, then add a capacitor to cancel the inductive reactance. The antenna is not resonant, and the impedance is not reactive. Where's my money?

>So, you are saying a 1:1 SWR can be achieved with JUST REACTANCE.
>Give me the impedance of a circuit with JUST REACTANCE that will
>yield an SWR of 1:1.

You now have the equation, figure it out.

>> To quote your challenge:
>> >If it is not resonant, then it is not 50 ohms.

>> >Give just one example to show how to do this.
>> >I'll give you $100 if you can.
>> In consideration of that, I think the generally accepted definition of
>> impedance is very relavent, and that is what I have used.
>
>It depends on what the definition of "it" is. :-D
>"IT" is what we have been talking about -- AN ANTENNA!

Great. And your definition of an antenna? Must it be resonant, even when I have shown, and you have agreed, that an antenna does not need to resonate? Must it radiate, even if that has no bearing on the transmission line? What difference does it make to the transmission line whether ZL is a resistor or an antenna? None, and you have agreed to that point. Where's my money?

>My argument is that, at that system impedance, there is only one antenna
>impedance, 50 + j0 ohms, that provides a 1:1 SWR.

Wrong. A reactive antenna can provide a 1:1 SWR, as I have indicated before. You can deny it all you want, and I'm sure you will, but the facts remain within your sight.

> Since that impedance
>is resonant,

Wrong again. That impedance, 50 + 0j ohms, is not necessarily resonant, since it is the same impedance as a resistor, the resistor being non-resonant. And any reactance in the antenna can be canceled with another reactive component. Would you like an example of a resistor that radiates? It is called an "antenna." Not that it changes what happens on the coax, which it doesn't . . .

>Again, this is a CB radio newsgroup.
>Many hams seem to forget this.

I am not a ham. I am an electronics engineer. And you?

>> I think the best option is for you to read a book and
>> learn something about the subject.

Don't forget the chapter in your math book that deals with imaginary numbers. You might want to pick up a logic textbook so you can actually see that your arguments, right or wrong, are almost completely based on logical fallacies. I gave you one, you find the rest.

And where are your references? I just want one authoritative reference that supports your claim that "50 ohms is, by definition, resonant." I'll type out an entire chapter from each book if you provide just this one reference. And don't forget the qualifier - that means you can't just say it's so, you need an author with proper credentials in a published paper or book that can be independantly verified. ISBN required. Hell, I'll even give _you_ $100 if you can do that.

Get your face out of that ill-informed "manual" and get on the air to
see what is being done in real life.

VHF SSB'ers routinely (as in "consistently") communicate far beyond
line-of-sight without benefit of exotic propagation modes or monster
amps/antennas. Here in the midwest, daily communications on 150-mile
paths, with simple yagis at 40 feet, driven with desktop rigs (50W or
less) are so common as to be unremarkable. The CW guys down around
144.075 consider 150-miles as "local".

Still not valid, don't give a damn what book you quote from. Many "rules" have proved to be just theories. Many can, and do, expect, AND work long distance on VHF, on a fairly regular basis, without the use of repeaters.

With all due respect, the items you have outlined are not within the scope of CB. Yes, we would like to see CBers interested in long distance communications etc join us. That being said, CBers are not required to keep ham radio going. Our numbers are larger now than they have ever been. I am sorry that your ears are plugged, but in spite of the protestations the FCC has said (as a result of the new law) that with the help of locals the problem would be addressed on the local level to remove the blatant violators. Hams had nothing to do with the law, But! our interference committee's have been in existence since 11 meters was a hamband and are a source of information for the local police. I would not disagree that some of the hams are salivating over the prospect of busting CBers but much of that can be placed at your own doorsteps.

I came in this conference with one purpose, that was to help anyone who had an interest in Amateur radio. No matter how reasoned a ham may be, there are those that vilify any who enter here. This will create animosities that justifies one helping to bust an illegal CBer.

I will admit that out of desperation I finally told a Cber in private mail to set himself and his trailer on fire, I am not easy to upset, but this idiot went way over the top sending filthy, vile messages to me. I have dealt with 2 others, one a ham by turning their messages invisible :>)

Why should the hams feel any need to give up 10 meters to a bunch of cbers who care nothing about operating legally, spewing foul language on the air, keying down over everyone else and turn 10 meters into another sewer pit of communication. If you want to run 100 watt radios, how about getting off you dead butt and get a ham license and *earn* the privilege to use 10 meters legally?

CitySlicker wrote:

This points one of the myths and wishes of *some* people. "Stodgy and outdated" rules, as you call them, are there for good reason. The simple fact is, without them, chaos would reign. For any communications service to be viable, usable, and effective there *has* to be some sort of guidelines. Without those rules and regs you "hate", the Amateur Service would be useless, its well-documented history of public service made null and void, and it would die of an internal cancer of confusion, chaos, and jammed frequencies. This would then lead to the rapid loss of spectrum that everyone often discusses. Even now, contrary to the mislead belief of some, the Amateur Service is NOT dead or dying. It will continue to live because of its recognition of value to the community, state, and nation, AND because of the rules and regulations that permit the maximum use of bands by the most people. Yes, it is true that a piece of paper (license) an operator doth not make. Some of the commitment to courtesy, technical learning, on-air discipline, and volunteerism has to come from the indivual.
Fred if you wish your beloved
> radio service to continue then all you hams had better petition for the new laws and regs
the would seduce the CB community to your ranks.

As I said above, the Amateur Service is NOT dead or dying. I am curious as to what you would replace the current regulations with? Correct me if I am wrong, but it sounds like you want the Amateur Service to be just like CB: go down to Kmart, buy a radio, and start talking. That, as I already stated, would lead to the demise of Amateur Radio, instead of the other way around. There *HAS* to be some sort of guidelines as to training, knowledge of electronics, and on-air discipline in order for Amateur Radio to justify its existence. One of the things we are missing here is that there *IS* a fundamental difference in the way hams (most of them)and CBers approach radio. On the ham side, there is MUCH more to radio than talking on one. There's building, testing, EME, satellite, weather tracking for NWS, disaster relief, and on and on. On the CB side it's mainly talking to friends, neighbors, doing skip, putting up beams, and stuff. But the main emphasis is on talking. I am not saying that is a bad thing. I'm just saying that the philosophies are different. As long as Amateur Radio continues to render service to the

community and the nation as a whole, there is no danger of it going away IMHO. There is something to be said for quality of operation in time of emergency as opposed to chaos caused by untrained and undisciplined operators who "just want to get in on the action".
Like labor unions no members no strength.
Amateur Radio's strength lies, not necessarily in "quantity", but in "quality". Of course, in ANY group, there are "renegades" who always cost that particular group "points" with other people/groups. The majority of hams operate professionally and within the regulations which give them plenty of leeway as written.

> As far as breaking the law it is just another form of speeding, illegal parking, J walking and thousands of other basically unenforceable laws on the books. So that argument is falling on deaf ears If you haven't noticed.
> If you are speeding, have a blowout and wreck-perhaps destroying someone else's lives and property, it suddenly becomes VERY personal especially to those *others* you have affected by your disregard for the laws that are there to protect YOU as well as others. If you jaywalk and get hit by a car, it becomes personal. If you park illegally....say...in the way of an ambulance at a hospital, you *may* cost the life of a heart patient. And so on.

> Some of you Ham operators are up in arms over 10 meter now that the skip cycle is peaking. 2 years from now there will be no interest. So you have a wasted band that could be utilized to free up some air space for the CB community.

What has 10 meters to do with the "skip cycle"? What the hams object to are the ones who encroach there such as the truckers with their "export" radios. What will hams do when 10 meters is not subject to "skip"?
The same thing lots of us do now. We talk to our local ham friends, use the local 10 meter FM repeaters--the same thing CBers do in the "down" cycle (except for the FM repeaters). Ten meters is NEVER wasted. It is used all the time whether there is "skip" or not.

> Radio regs should be changed to allow 100 watt radios.

What is the magic of a "100 watt" radio? If the "skip" dies away and limits 11 meters just like 10, why do you need 100 watts to talk to the guy 5 miles away? Now I'm just presenting facts here--no flames. But CB was never intended to be a "hobby" band. Surely, you already know that. I don't really care what power you run within your own "turf", but IF CB is operated the way it was intended, one doesn't need 100 watts. For local talk, I think realistically, they should make it 25 watts. You would be surprised what the ham guys do with the HTX10 on 25 watts.

This would spawn a
> whole new stimulus to the Cb radio manufacturers. Better quality radios
> would be developed as well as related equipment. Quality manufacturers like
> Uniden, Kenwood etc would rush to the opportunity to develop legal 10/11
> meter radios for CB use. They realize that there is no interest in 4

I doubt power has anything to do with it, IMHO.

> Would this stop higher power amp use? probably not. But a large percentage
> of users would find the 100 watt capable radio with improved receivers and

>
> If you want to preserve Ham radio you better find a solution in putting your
> arms around the CBing public and providing some stimulus to those 10/11
> meter bands.

See above. There is already enough "stimulus". Just look at all the
bandwidth available to the hams. Even above 30 MHZ, there's lots to
do! Do I ever run into the "buttholes" like N8*** on ham radio? SURE!
But there's so much more, so many more freqs I can go to, it really
isn't an issue. I just ignore 'em and go find a nice group to join. If
I want foreign DX, I can most always find it on 20 meters. Nets? They
are everywhere. Technical discussions? Ditto.

Bills like the one just passed are not a solution it is
> inflammatory and could cause some serious harm to those concerned ham
> operators that want to assist in the local authorities enforcement.

Contrary to some beliefs, this bill was NOT pushed by hams. It got
started because some non-radio types in Wisconsin and Michigan were be-
ing swamped with hi-powered, unstable CB radios. They contacted FCC and
got very little help (I guess that's because of their lack of funds??)
They contacted their congressmen (Feingold and Ehlers)who, in turn,
also contacted FCC. They got very little either. This pissed them off,
to put it bluntly. So they sponsored several bills over the last sev-
eral years. The only ham involvement thus far was that ARRL lobbied for
and got an exemption for the Amateur Service. Now. I think, like you,
that for self-righteous hams to get personally involved is foolish. I
wouldn't touch it with a 10 foot pole! I totally agree that this new law
will have some unforseen, inconvenient, and even tragic results.

That right there is the main reason for the other companies springing up.

People got tired of waiting.

Waiting for product to be shipped.
Waiting for questions to be answered
Waiting for phone calls to be returned.

Bottom line... Make your customer feel like he is dogshit, he will go to
the next person in line.

You didn't read that too well Sparky. He said theory based
on empiric data over a long period of time. That isn't 'theory',
it's 'fact'. (you blew that one Sparky)

Hi,

What is the cleanest 100 watt amp I can find for both 10 and 11 meters?

Thanks,
Chris

If a neighbor calls
and reports a disturbance, the officer arrives and knocks at the door,
nobody answers, but the cop can hear what he PERCEIVES to be the woman
(or man in some cases) getting the shit beat out of her, can he enter?
Absolutely!
This is absolutely false! He can not beat down your door. If he did
that every hard ass cop would stop and "inspect" random houses! Not
likely...If there we're gunshots i could believe it.

It "sounds like" you are making subjective comments without providing
anything useful. So can you provide the references that he can't, or
are you just his flunkie coming to make sure he doesn't drown alone?

Sparky,
I couldn't care less what your email address is, what
"anylength's"
email address is, or what color your hair is.
I have not disputed any facts in this thread. I have, and do
dispute your claims, which are not fact.
I have asked several intelligent questions of you in this thread
and have received nonsense for answers. I seemed to have heard a lot
of that type of responce during the last several weeks, during the
election. I wondered if you were the person that I heard, since you
and he share a commonality.
No, I am not "anylength".

That is four direct answers to questions you've asked. I wish you
would make the same number of direct answers to questions put to you.
'Doc
PS - (Not going to hold my breath till that happens though...)

A delta-match is the linear equivalent. The principle is the same, in that the impedance is transformed through the variation of the distributed constants of the transmission line. In one case the variation is stepped, the other is linear. Now, how does that have no bearing on this?

My own experience agrees with Hans'. Secondly, if you're going to pretend to have done any heavy VHF use, then learn the difference between DIFfraction and REfraction. What you have referred to as edge refraction is actually edge diffraction - very common in hilly and mountainous terrain.

VHF propagation is very seldom optical line of sight with edge diffraction sometimes helping, but with atmospheric refraction often extending the range well beyond the optical horizon. The VHF Antenna Manual explains such things in detail, and offers nomographs and formulas for calculating your station gain, because the simplistic geometric formula you gave elsewhere is only a first order approximation. Geometric propagation models seldom agree with wave propagation models in a realistic environment, and wave propagation models come closest to observations.

Hans was trying to tell you that VHF users are aware of the pessimistic nature of geometric models by virtue of their own experience.

Never argue with experience. You'll just look foolish to those of us who have accumulated it.

Actually, the manuals aren't too bad. Jeff is simply not reading the
advanced chapters.

But then, someone who doesn't know the difference between diffraction
and refraction, and someone who apparently hasn't operated non-repeater
VHF isn't to be taken too seriously.

My experience agrees with yours, even when operating in the past from
the very hilly terrain of western Pennsylvania. 10 watts of A.M. into
an 11 element, horizontally polarized Yagi was more than sufficient to
maintain reliable contacts with stations 110 miles away from me and with
a hill apparently blocking the path in that direction.

The ARRL VHF handbook I used made it quite clear why that kind of
operation was possible once you plugged the correct numbers into the
correct places. It also made it quite clear to me why appliance
operators like Jeff would be quite baffled by such a reality. (He
probably hasn't found the part about station gain yet.)

If a police officer has reason to believe that a crime has been commited, is
being commited or is about to be commited, that gives him a legal right to
enter your house without a warrent. That's the definition of probable cause!
Period. That's the law. Believe, I know. Hearing a woman screaming for help as
he walks down the street gives him that probable cause.. now, if he's walking
to your door and putting his ear to the door, that's quite illegal...

Fred,
"Q" has no application in this, lets stick to what we're
talking about. The point was, if there were no reactances,
Xl = Xc = 0, and there is a 50 ohm resistive element left,
then you have a 50 ohm resonant antenna. In this instance
your bringing up 'Q' is merely obfuscation of the fact that
you 'screwed up'.

On Mon, 18 Dec 2000 03:11:06 -0500, Handy Andy <CodysPC@Iserve.Net> wrote:

*Greetings!
*
*I'll go into it further, all the "coax police" are acting like the
*Keystone Kops on this...it's hilarious!
*
*Ya' gotta love these people.
*
*Not one of you got the hint.
*
*I guess I'll have to connect all the dots...
*
*If you remember the Magnetic mount, and how I got it, being used and
*abused. The antenna itself too.
*
*No, I didn't replace the coax,
*
*No, I didn't check the PL259 connector,
*
*All I did see is RG-58 on the jacket.
*
*It was 8 feet long.
*
*I didn't check for shorts, or opens...
*
*But, in the end, I was able to see an SWR of 1.2 - but the meter was
*never steady.
*
*Now, with the above in mind.
*
*Did I tell you the location I put this at - no.
*
*It was on the trunk lid of my 76' Chevy Nova. You know the type, 262
*V8 Rochester 2GC carb, and all unibody rusted hulk of a vehicle.
*
*Now, if things worked like they should - I will say again, I should
*have seen a 2 SWR.
*
*The first time I did. Actually it was a 2.7 SWR - placing you hand on
*the coax or meter at the wrong spot gives you an unsteady SWR reading.
*
*Thats a good clue...
*

*This was using the original coax that came with the mount.
*
*I grabbed a barrel connector and added on a 9 foot patch cord.
*
*Now the SWR was 1.2.
*
*Did I check continuity? No.
*
*What finally came out was the 8 foot coax section not only was bad, it
*has a weak short due to water entry at the mount.
*
*So what it means is, even though it should have been RG-58 - it wasn't
*perfect coax to begin with.
*
*Adding on a patch cord in length did something to the SWR.
*
*The mess would show a near pefect SWR on some days, others it
*wouldn't.
*
*The point I'm trying to bring up with all these people making these
*assumptions...
*
* Did you ever bother to ask the guy what they did by
* themselves in an attempt to correct a problem?
*
*Considering I had a 1.2 SWR - I could have just left it at that. And
*for a while I did, it was only a cheap TRC-412 at the time I was using
*anyways.
*
*The only reason why I have some information - is because I had kept
*the antenna and mount in a shed. When I moved to my current location I
*came across that antenna and with my MFJ I wanted to see something. I
*can't re-create the car, so I used the Aspire.
*
*The reason why I kept it was because of the friendships it created.
*There's a lot of memories for a person starting out in something new.
*
*This is what makes me laugh at you guys, you too literal in terms and
*are not willing to make an effort to open your mind to other possible
*reasons why things work the way they do.
*
*Sorry dudes, you folks really know how to ramble on.
*
*This thread is case and point.
*
*If a CB'er doesn't put their stuff together right, you have a problem.
*
*You never ask "Why?" or "What is the problem?"
*
*I've re-created it for you and you still don't understand...

*
*Sigh...You guys are phonies. You haven't even tried...
****

I see from a more elaborate description of the problem that you have common mode current on the outside shield. Common mode current will affect the acurracy of most low teir to mid teir SWR meters. By placing your hand on the SWR meter or coax the common mode currents are reduced. The same thing should happen if you were to coil the coax. Also placing a ferrite core over the coax and the common mode currents will go away. Common mode currents are very possible and very likely to happen in mobile installations due to vehicle construction and condition. Common mode currents due not in any way alter the SWR at the antenna. Until you can accept that then there is little or no more that I can due to help you understand what is happening.
When placing the transciever and feedline in close proximity of the field of the antenna, common mode currents most likely will occur. As you so nicely stated the condition of the original section of coax is in poor shape. Damaged coax can lead to inconsistant readings. When SWR measurements are taken there are these variables that affect the meter reading:

1) common mode currents.
2) load impedance.
3) coax condition.
4) meter tolerance to mismatch.

Common mode currents unbalance the currents that are induced when a RF wave travels down a coax. Yes a coax feed is unbalanced. The unbalance is in respect to the currents that are induced into the antenna and not in the coax. By unbalancing the currents in the feedline we introduce error in the SWR measurement.

Load impdance must remain constant for constant SWR measururements. In your case there appears to be a fraying of the coax at or near the antenna feedpoint. Water intrusion at this point can cause damage to the dielectric. Chlorides in the water and in the coax now have a medium in which to create RF impedance bumps in the coax. Literally at the point of damage the characteristic impedance is altered. At this point simple mathematical models now become more complex. Instaed of one continuous homogeneous impednce along the coax, we have a series of complex impedances that need to be accounted for. This does help in trying to make an SWR measurement.

Finally the meter itself can be avariable. Bridge type meters are designed to work in 50 Ohm system. How accurate they are when trying to measure above 3:1 is very dubious. In fact most meters start to loose accuracy above 3:1. Most Solid state transmitters do not liek to operate at SWR greater than 3:1. At SWR greater than 3:1, the meters do not detect other problems that occur at these SWR levels. That is for another discussion later.

I have already explained how SWR and matching occur. Yes coax length can be used to satify the needs of the transmitter. Yes when you put a SWR meter at the transmitter with said length, the SWR can read as low as 1.1:1. The fact is the SWR at the antenna is not affected. This technique of matching is in my opinion

a last ditch effort to obtain a match condition.

```
*****************************************
*Ask the person if they've done their homework and put the stuff
*together right. This is why the coax length stuff comes up in the
*first place.
*
*Improper assembly.
*Didn't double check their work.
*
*The two sentences above are the ones you guys should really be looking
*at when it comes to your conduct to people that ask a question about
*coax.
*
*I don't have to go into this any further, the atypical [no one in
*particular] CB'er is no one special - just wants to use a radio.
*
*They don't have any special tools, not one clue about a smith chart.
*They'll be dammed if they're going to a Dennys and ask a bunch of
*Hammies sitting for coffee he was invited to join over his radio, and
*ask "Coax length" questions. [The reactions to this topic are as close
*to textbook cases of Signmund's own signature line with a mix of Twain
*too - LOL!]
*
*If this thread stays on deja-news - I hope that the persons having the
*problems with antennas read this. It's a perfect example on how people
*over-react to such questions.
*
*Some know how to answer, others know an answer, but only one has asked
*what the problem is.
*
*Think about your conduct.
*********************************
```

I have thought about my conduct. I see little that I would change. Yes my explanations are very detailed and lengthy. I meant them to be. There are many myths about RF wave propogation, especially in transmission lines, that abound not only in CB but in Amatuer Radio. There are many over simplifications that lead to distortion of what really is happening. SWR is not just inserting a meter in line and taking a measurement. SWR is a condition that exists on the transmission line. It is soley determined by two things, the load impedance and the characteristic impedance of the transmission line. Inline SWR measuremets are primarily used to determine the state of mismatch if one should exist. When SWR readings are taken at the transmitter end of the coax, the SWR readnings determine any mismatch from the transmitter to the coax. Not transmitter to the antenna. While the antenna and the coax can be construed as one circuit, it is not. The coax is a two port element, ie an input and an output with a tranfer function to describe what ocurrs to the signal while it travels from the input to the output. The antenna is another device in itself. The two make up a system. Remember they are two distinct items in a system.

I challenge you to take an antenna that has a high SWR. Place a SWR meter at the transmitter. Measure the SWR. Now add coax to make the SWR as low as possible while maintaining the SWR meter at the transmitter. Then move the SWR meter to the base of the antenna. Mesure SWR there. See if there is a difference. IF there is, then try and justify why?

I have tried to shed light into what is happening when one just inserts a meter inline to read SWR. I generally do not like to get into pissing contests, but I have gotten into this one. I will stand behind all my posts until proven wrong. When one makes a bold statement without truely understanding what is happening, I like to inject knowledge as to why some things happen. I do not knock what one learns from practical experience. Practical experience is a good teacher. Practical experience does not necessarily teach thoroughly what is happening in many electronic situations. RF propogation and transmission lines are one. Yes one can experiment and derive results. These are legitimate results. They are true and tried and they correct problems. But they are obtained from trial and error. I try to give reason to the trial and why the errors ocurr. Sometimes I succed and sometimes I do not.

Also one note. I do agree to some extent that some of the amatuer radio publications are at times somewhat over simplified. Remember this, the intent of some of the amatuer publications is to introduce concepts of electronics to people that are not formally educated in the vast area of electronics. The lower amatuer radio licenses cover only the concepts of many electrical laws. Most are deal with ciruits. Antenna theory and RF propogation are not heavily tested. The intent of the Amatuer Radio Service and the CB Radio Service was to not restrict membership to those who are degreed engineers. It is to open to the vast population. I encourage those to question. Question incite conversatrion and a discussion of ideas. This leads to a net gain in knowledge. That is the main importance of a discussion group. Exchange of ideas and the quest for knowledge.

Let's see, in this post you've contradicted yourself about
resonance, reactances, conjugate matching, and impedance
matching. What you claim in ~this~ post, you have refuted
in previous ones. Make up you mind Sparky, you can't have
it both ways. Or better yet, go back and read those texts
you've been 'paraphrasing' and see what they really said.
Paraphrasing requires understanding, which you obviously do
not have.

Handy Andy,
Oh, I am enjoying this too. I've made notes of several
of the pseudo-tech-speak phrases and plan to use them when
I want to see people laugh, I should at least thank you for
them, and I do!
I was going to advise you to 'get back on the porch', but
I see that you had that in mind anyway. Thank you for saving
me the trouble.
As you said, this has deteriorated in to some very basic
ideas. But when some people's ignorance is shown to need
such a digression, it just has to be done to show them the
error of their ways. The curative for ignorance is knowledge,
but there's no cure for stupid. Now go take your medicine.

by definition, a center loaded antenna is an antenna where the distance between the coax feed point and the coil will be equal to the distance from the coil to the end of the antenna. I gather that this installation is on a tractor. IF so, then yes the coil should be away from the metal of the vehicle as far as possible. The metal of the tractor and/or the trailer will alter the load coil's inductance and thus affect the antenna's impedance. This will lead to a difficult time is obtaining a low SWR measurement. I would mount the antenna as high as possible. Try and get the load coil as far away from the metal structure. This may result in the antenna being mounted on the mirror arm. There are trade offs for this. On the mirror arm there is less metal under the antenna. Therefore the radiation pattern is affected. But you most likely will be able to obtain a match. Again if the antenna coil is to close to the body of the tractor then a difficult match will be seen and also radiation pattern will be affected usually for the worse.

Doc, you know better than that. At least I hope you do. Assume you have the mythical 50 ohm antenna matched with perfect coax and resonance is achieved to perfection. Now you decide to switch to another channel on CB or QSY 10 Khz on ham, are you still 50 ohms?

Coax Length Police,
I can understand that! By the way, the information on one
of the sites about coax. It was taken (out of context) from an
email they received about the ~really~ screwed up information they
formerly had on their site. They re-wrote it a bit, changes a few
words here and there, and are now using the result. The original
email wasn't copy-righted so they were free to do what they wanted
with it. In the long run, it really doesn't matter. The ones who
are smart enough to wonder about it will find out the truth. The
ones who don't wonder will just continue being 'taken'. " It ain't
my job to mind'em this week! "...

****

RG-58 is not bad coax for low to medium power applications and short distances.
It is used by many antenna manufacturers due to it's cost. If the antenna is 50
Ohms then this shows any coax length will work. I would have kept the extra
length coiled up especially if one operates over 100 watts in the car. The
coiled coax will help prevent common mode currents that can build up on coax
when used in mobile installations.

No, it isn't.

> the figure of merit for the resonant circuit.

'Q' is not a "figure of merit." It is simply a ratio of a
circuit reactance to the circuit resistance. Having a high
Q is not necessarily good or bad; it depends upon the application.

And, once again, you have changed the subject and sidestepped
the issue at hand.

> If I have a series circuit consisting of a resistor, a
> cap, and an inductor, are you saying the resistor doesn't count?

Who cares?

The real question is: do you agree with what Doc wrote above?
If not, why not? Stop dodging the issue.

> > Z = (R&#65533; + X&#65533;)^&#65533;

Oh, OK. I found out where you got this equation and, as I suspected,
you are using it out of context. Furthermore, it is the MAGNITUDE of
the impedance -- not the impedance -- EXACTLY AS I SAID. It does not
fully specify the impedance.

I'll type slowly so you can follow along. The following quote is
verbatim (word for word) from the 1989 ARRL Handbook, page 2-25.
I will convert some letters to capitals for emphasis.

---- Begin exact quote from 1989 ARRL Handbook, page 2-25 ----

Converting from Rectangular to Polar Form

The easiest way to perform multiplication or division on a complex
number is the use of polar form. Although it is possible to multiply
complex numbers in their rectangular form, it is actually easier to
first convert rectangular form to polar form and then perform the
operations necessary. The MAGNITUDE of an impedance in polar form is
equal to the distance the plotted impedance is from the origin. The
Pythagorean Theorem provides a simple means of calculating this
distance. The MAGNITUDE is equal to

Z = sqrt(R^2 + X^2)

---- End exact quote from 1989 ARRL Handbook, page 2-25 ----

So, you are calculating the MAGNITUDE of the impedance in polar
form. However, this 'Z' term does not fully specify the impedance; you
must specify the angle also. The ARRL provides information for
calculating this next but you conveniently omitted it.

I have to admit, however, the ARRL Handbook is confusing. What it
correctly calls magnitude here, it incorrectly calls impedance in the
subsequent section. That is the source of your confusion. Blame the
ARRL.

Let me add some more correct quotes to hopefully help your
understanding:

---- Begin exact quote from 2000 ARRL Handbook, page 6.54 ----

Impedance is the complex combination of resistance and reactance.
Since there is a 90° phase difference between resistance and
reactance (whether inductive or capacitive), simply adding the
two values will not yield what actually happens in a circuit. Therefore,
expressions like °Z = R ° X° can be misleading, because they
suggest simple addition. As a result, impedance is often expressed
°Z = R ° jX.°

---- End exact quote from 2000 ARRL Handbook, page 6.54 ----

Hmmm. Look familiar? That is the equation I wrote.

---- Begin exact quote from 2000 ARRL Handbook, page 6.55 to 6-56 ----
---- text substituted for non realizable Greek characters ----

Combining the resultant impedance with the angle provides the impedance
in polar coordinate form:
Z (at angle theta).
The expressions R ° jX and Z (at angle theta) both provide the same
information, but in two different forms.

---- End exact quote from 2000 ARRL Handbook, 6.55 to 6-56 ----

You omitted the calculation for the angle so your 'Z' did not fully
represent the impedance. My "R ° jX" did.

*I totally agree, changing the length of coax, particularly on a mobile
*installation, which is how this thread started, introduces various values of
*XL or XC which in combination with the antenna lets a radio see 50 ohms.
*
*No 1/4 mobile antenna is 50 ohms. A perfect 1/4 wave over perfect ground is
*25 ohms and it increases from there do to losses. By moving the antenna from
*resonance and introducing some reactance we can make it look like 50 ohms.
****

In fact an infinitely thin 1/4 antenna over a perfect ground is 36.5 + j24.5 Ohms. Half that of an infinetley thin half wave dipole. 73+j49 Ohms. if I remember correctly. Yes the magnitude of the impedance can be raised to 50 Ohms But that will not yeild in a 1:1 SWR. One needs to add some matching network to transform the real portion up to 50 Ohms. This can be done by a gamma match, hairpin match, beta match or lumped constants. A least desirable method is to adjust coax length. It's Q is to high and thus SWR bandwidth is to small. For a vertical antenna a gamma match is ideal to raise the real portion of the impedance up to 50 Ohms. IF one carefully examine the construction of the gamma match you will see it is nothing more that a transmission line transformer.

Remember only the real portion of the antenna impedance radiates power.

It is amazing at how the cbers run down the amateur service with the required testing to qualify for a licensee, and talk about it's "stodgy out of date rules and regulations", but can't seem to realize that because of the cb attitude
of total disregard of rules is why 11 meters is the sewer pit of radio communications. Those so called outdated rules and regulations that 99.99% of the hams follow is why there is no comparison between ham radio and the chicken band.
The last thing the amateur community wants to do is bolster the ranks with cb operators as the last thing wanted on the ham bands is cb type operation, , but if you want to become a *ham operator*, and abide by those "stodgy outdated
rules and regulations", which keep the amateur bands civil and useful then welcome aboard.

I found a link on his page, on that link I found these lyrics. He should read how true these words realy are.

"I feel I've been beaten down
By the words of men who have no grounds

I've seen the wicked fruit of your vine
Destroy the man who lacks a strong mind
Human pride sings a vengeful song
Inspired by the times you've been walked on
My stage is shared by many millions
Who lift their hands up high because they feel this
We are one We are strong
The more you hold us down the more we press on

I know I can't hold the hate inside my mind
Cause what consumes your thoughts controls your life
So I'll just ask a question
What if?
What if your words could be judged like a crime?"

The topic is MURS, whose users will be using 1-2 watts on FM with rubber
flex antennas. Attempting to make these folks believe they'll be able
to communicate over a distance of 150 miles is an outrageous lie.

Fred,
There's two ways of answering that question, one way is to say
that if it's a perfect antenna, then nothing would change. But
that's a 'cop out' answer, and garbage. Unless the 'Q' is very
low, the 'match' will have some reactive component. What I ~should~
have said was that introducing another 'property' of an antenna at
this point, is only asking for trouble. Sparky can't keep to the
subject now! Giving him another 'area of obfuscation', is like
beating your self on the head with your own bat.
'Doc

And the equation Z = R ± jX does not specify magnitude until you make the term 'j' a real number. And how do you do that? Square it. What is the equation you end up with? Z = (R² + X²)^½. That is how you get a 'real' value of impedance. Even the ARRL isn't confusing about this.

>correctly calls magnitude here, it incorrectly calls impedance in the
>subsequent section. That is the source of your confusion. Blame the
>ARRL.

So you are saying that _you_ are correct, but all the wisdom and experience of the engineers at the ARRL amounts to squat? Just what are your qualifications?

Polar notation does not give you a real value. That is what rectangular notation is for, because rectangular notation is the application of the Pythagorean Theorem to polar notation, i.e. angles, i.e. planar coordinates, i.e. VECTORS. You read, but you do not understand what you are reading. That is why it is confusing to you. The ARRL isn't wrong, you are.

Check this out:

(22.36² + j44.72²)^½ = 50 ohms
(73² - j0²)^½ = 73 ohms

The resonant antenna is mismatched and the reactive, non-resonant antenna is matched. Now look at a different example in polar form:

Zsource = 37 + j15 ohms
Zload = 37 - j15 ohms

Is that an impedance match? Yes. Will it reflect power? No. Is the load resonant? No.

This means that the only way to eliminate standing waves is to properly match the antenna to the coax/source. Then, and only then, do you not need to worry about the length of the coax (except to make it as short as possible), which is what I have held all along.

And you omitted the rest of my post.

There is really no need to reply. You can't support your claims and you refute any authority in conflict with your position. You claim to be some sort of coax guru but you don't even know how to add vectors. Your arguments are logically flawed and substantially deficient. When you can no longer ignore the issues you send your buddy to try and disrupt the exchange.

Let me know when you finish school and then maybe we can have an intelligent conversation.

Greetings!

Thanks Doc,

But one question that is still in my mind...

It deals with elements and surface area available for ground.

What occurs when there is not enough surface area to make the antenna
resoant at 50 ohms?

Hint, 8 feet of ground surface, but trying to work a 9 foot antenna.

It's when things are not equal.

When you can answer that, I will go to bed.

On Tue, 19 Dec 2000 20:15:54 -0600, while the modem was ice fishing
with the Mouse, 'Doc <w5lz@oio.net> dissertated the following:

My use of CB is strictly mobile. Highway communication. A Ham radio would not fit the need until all the Truckers,and service people on the highways began using them.
The Ham community wants the 10 meter band when it suites them. Like today's current skip cycles. 2 years from now the band will be dead and unused.
Regarding by dead butt; I own a successful 5 person sales agency, spend 40-50K miles a year on the highways. So earning my ham radio merit badge just isn't a priority. Especially, if all I had to communicate with were narrow minded geeks like yourself. If you didn't understand my post than you better thank God for multiple choice answers on tests.

Fred one more thing, why did you feel compelled to come to this NG "to help anyone who had
an interest in Amateur radio" people in this NG don't really care about the Ham world and they know how to find their way to the amateur NG. Are you a troll? Are you trying to impress someone here? 10K amps in a mobile is what is impressive here or haven't you noticed. I am sorry to here that some of the mental midgets resorted to improper e-mail. Somehow I think you may have encouraged it.
Take your Ham gospel where it belongs. If you have something of value to add regarding CB radio then by all means post it here. I think your bright enough to know the difference.

Chris, unless you are looking for a driver for a larger amp a 100 watts doesn't buy you much. A uniden 76 can be modified to put out 50+ watts Galaxy and Ranger have radios that can easily do that too. Go for a Texas Star 350 or Cobra 350 Blue Face not much difference in price over a 100 watt but far greater talk power.

Hey, vector boy, you believe:
22.36 + j44.72 ohms = 50 ohms

which means you believe:
50 (at 0 degrees) ohms is equal to 50 (at 63.43 degrees) ohms.

Weren't you the one who asked me what a vector was? (Yes)
Is a vectar at 0 degrees equal to a vector at 63.43 degrees? (No)
If I made you drive northeast for 50 miles, would you be at the
destination which is 50 miles to the east? (No)

Correct me where I'm wrong. ;-)

Sparky, you're out of your league here. "Z = R + jX" does indeed
specify the magnitude of the impedance AND it specifies the angle.
The ARRL Handbook clearly shows how to find magnitude and angle
from these values.

You are really hung up on these polar coordinates. In general, there
is really no need to EVER specify an impedance in polar coordinates.
The ARRL Handbook was merely attempting to make the math a little easier
for non-engineering types like yourself who don't have access to an
engineering calculator which readily handles impedance in rectangular
coordinates.

Most engineers use rectangular coordinates for impedance (by the way,
this is confirmed by the ARRL Handbook). The reason being that
rectangular coordinates are more readily plotted on a Smith chart which
specifies impedance in terms of real and imaginary components. Try
plotting 38 (at an angle of 42 degrees) ohms on a Smith chart. You have
to convert to rectangular coordinates first.

> >I have to admit, however, the ARRL Handbook is confusing. What it

>
> So you are saying that _you_ are correct, but all the wisdom and
> experience of the engineers at the ARRL amounts to squat? Just what
> are your qualifications?

Well, if the ARRL Handbook contradicts itself, how can it be correct?
The reality is that the ARRL Handbook was written for non-engineers. It

does not adhere to strict mathematical definitions because doing so
would make it far too difficult for folks like you to follow.

> Polar notation does not give you a real value. That is what
> rectangular notation is for, because rectangular notation is the
> application of the Pythagorean Theorem to polar notation, i.e. angles,
> i.e. planar coordinates, i.e. VECTORS. You read, but you do not
> understand what you are reading. That is why it is confusing to you.

Polar and rectangular coordinates are simply two ways of specifying the
EXACT same thing. However, you were providing only HALF of the
impedance information in polar coordinates; you were providing ONLY the
MAGNITUDE but not the phase. Thus, you were not fully describing the
impedance.

> The ARRL isn't wrong, you are.

Then answer this:
If the ARRL calls 'Z' the MAGNITUDE of the IMPEDANCE and then later
calls it the IMPEDANCE, how can both be correct?

Is 'Z' the MAGNITUDE of the impedance?
Or is 'Z' the IMPEDANCE?

The equation they provide is for MAGNITUDE.
However, 'Z' is the universally accepted term for IMPEDANCE.
The magnitude of Z is correctly written as |Z|.
Perhaps the typesetter left this out.

> Check this out:
>
> (22.36 + j44.72)^ = 50 ohms
> (73 - j0)^ = 73 ohms
>
> The resonant antenna is mismatched and the reactive, non-resonant
> antenna is matched.

You are wrong. Neither is matched. Let us correctly apply the ARRL
Handbook formulas to achieve the correct answers:

22.36 + j44.72 ohms = 50 (at 63.43 degrees) ohms
73 - j0 ohms = 73 (at 0 degrees) ohms

Now, for a match, the impedance MUST be 50 + 0j ohms.

50 + j0 ohms = 50 (at 0 degrees) ohms

50 (at 0 degrees) ohms is NOT equal to 50 (at 63.43 degrees) ohms.

Weren't you the one who asked me what a vector was? (Yes)
Is a vectar at 0 degrees equal to a vector at 63.43 degrees? (No)
If I made you drive northeast for 50 miles, would you be at the
destination which is 50 miles to the east? (No)

> Now look at a different example in polar form:
>
> Zsource = 37 + j15 ohms
> Zload = 37 - j15 ohms

This is not polar form; it is rectangular form.

> Is that an impedance match? Yes. Will it reflect power? No. Is the
> load resonant? No.

Well, let's assume we are using a transmission line with a
characteristic impedance of 50 ohm as used by the overwhelming majority
of CBers (this is a CB radio newsgroup, remember?).

Is that an impedance match? Only if the transmission line is a multiple
of 1/2 wavelength; this is the only condition that will allow the source
impedance to be a conjugate match to the impedance seen on the coax
input.

Will it reflect power?
At the antenna? Yes.
Into the radio? Only if the transmission line is not a multiple of 1/2
wavelength. If the coax is a 1/2 wave multiple, a conjugate match is
established and no power reflects into the radio despite the fact that
there is power traveling in both directions and standing waves on the
transmission line.

> This means that the only way to eliminate standing waves is to
> properly match the antenna to the coax/source.

The only way to eliminate standing waves is to match the antenaa to the
characteristic impedance of the coax. You will have to achieve 50 ohms
(i.e. 50 + j0 ohms or 50 [at 0 degrees] ohms). Got it?

> Then, and only then, do you not need to worry about the length of the
> coax (except to make it as short as possible), which is what I have
> held all along.

Even with a mismatched antenna, changing the coax length does not change
the SWR so you NEVER have to worry about changing the length of the coax
because it doesn't matter.

3280. Re: A bust happens from new (read "purposed") law!!

Dick, My previous message stated WITHOUT some matching network. I agree than you can match a number of ways, 1/4 wave stubs, tapped coils etc. The statement was made that a whip antenna could be cut to resonance and by the posters definition it was 50 ohms. He claimed that all resonant antennas were 50 ohms.

I challenged him to come up with a single antenna that was 50 ohms with out some type of matching. Heck I have matched rain gutters with a gamma match.

Polar notation doesn't give you a real value? Oh come on Sparky!
Of course polar coordinates are 'real'. Not only in electronics,
but in many other applications. How about navigation, isn't the
TACAN nav-aides real, how about when an aircraft is given a vector
to fly (polar coordinates, direction and distance)? Polar notation
is very real Sparky, but I'm beginning to wonder about you...

I wish I had seen this earlier so you could have gone to bed
at a reasonable hour.
What do you do when there isn't enough surface area to make
an antenna resonant at 50 ohms? One answer is to load it. Now,
go to bed.
'Doc

Uh-uh! We were not talking about them kicking your door in for radio interference. We were talking about laws, not rules and regulatons. What you refer to IS sitcom material, but no one alluded to that scenario other than you.

I notice the website's been changed. The voting function has disappeared and the tone is noticeably less "militant."(Although an image of a "black" helicopter has appeared.) The picture of his QTH(It appeared to be a trailer home.) has also disappeared.

He's probably a decent guy...albeit this site does indicate that somethings amiss. I actually feel a little sorry for the guy. Just think what must it take for a person to get to this point...alot more than rf interference.

Merry Christmas and Happy New Year to all in the group.

MR.PAIN&#65533; Replied :
You can't do any better than that Fatboy????? That registered moron shit is kinda old and so are the squirrel droppings, but that's cool Im not the registered child molester. Do you think you you could get your mind off of food long enough to come up with something else Fatass???? There's a donut in it for you, maybe even some chocolate!!!! I might even give you the dried french fries under my seat if your a good little fatboy!!!!

Oh yeah, Whats up with that hairdo ? Ever heard of shampoo? That is some Nasty, Greasy looking funk.If I were you I'de shave that stank off!

Why dont you join the Mr.Pain&#65533; Fanclub you'de have alot more fun! you might loose more than 50 pounds , and yes you might even meet some honeys that If I got them real drunk might even give you a peice!!
Thats assuming they could find your little Pepe under the ole spare

tire!
Have fun with this one, because it only brings a smile to my face , and
I'm back out Eat a Twinkie&#65533; for me!!!
Mr.Pain&#65533;

Please excuse if this has been covered, but I'm new to the group.

I gather there is a new Federal law allowing States to make laws on CB and then enforce them.

Can the States enhance the permitted features? For example, could they allow 25 watts FM?
Could they allow Spread Spectrum transceivers?
CTCSS?
Digital transmitter identification?

When using coax to match a transmitter to an antenna the term SWR, as seen from a meter located at the transmitter/coax junction, is not exactly the correct termonolgy. Instead we are not measureing the SWR at the antenna, but we are using a SWR meter to determine a matched condition. We can see a matched condition by two means:

1) adjusting the antenna and/or antenna matching network
2) adjsuting the length of coax

With the SWR meter at the transmitter/coax junction we will see the same results. That in no way is an acurrate measurement of the SWR on the line itself. Measureing the SWR on a transmission line is not just inserting a meter and reading some numbers. Most measurements taken at the transmitter output are just an indication of match to the transmission line. Ideally it is best to match the load to the characteristic impedance of the transmssion line and also the transmitter to the transmission line. In this situation the transmision line becomes nothing more than a very low loss conduit for the RF wave to travel down to the antenna. Introduce a mismatch at the antenna end and we introduce more obstructions in the conduit. Now due to some very nice laws, the length of the conduit can be altered to allow the transmitter to think that the load on the other end of the conduit is matched. In reality it is not. By adjusting the length we reduce some of the affects the antenna mismatch introduces. We do not total reduce the obstruction in the conduit but we reduce them some. The transmitter is happy, but we could have a more efficient system.

You sort of answered your own question in a sense. The various states will be able to create law to enforce existing federal law, id est, they could only allow local law enforcement to handle the many complaints and issues arrising from illegal use of CB equipment. This would in no way permit states to allow greater privileges. Since rf crosses state and national boundaries, the issue of who gets to use what ultimatesly is a federal matter.

In the three years I worked at Coast Guard Radio Honolulu, we had only one reported case of tropo ducting permitting comms between us and the West Coast (CG Radio Long Beach). Those channels were busy 24 and 7, yet only one reported case (the operators were to log everything possible, especially any propagation anomalies). For you to mislead prospective users of this new CB service, MURS, into believing that they have greater than LOS comms with an HT is nonsense.

>It also made it quite clear to me why appliance
>operators like Jeff would be quite baffled by such a reality.

Appliance operator? Most of my HF transmitters are homebuilt from scratch (transmitters for 160m, 80m, 40m, and 30m). I began building Heathkits when I was an 8-year-old young pup in 1962, and have been building gear since. Go back to the '93 and '94 archives and look up the circuits I used to post on here with their ASCII schematics, trying to encourage others to build their own gear. My current project is the rebuilding of a Galaxy GT-550 xcvr with the ultimate goal of rewiring the final stage so it will run 6146s instead of the expensive 6LB6s.

I have a question for all single sidebanders out there.

Why is everyone congregating on Channel 38 lower????

Last time I checked, channels 36 through 40 were considered as sideband channels. I hear very little activity outside of channel 38L.

It is bad enough that the number of SSBers has dwindled over the years. If were do not use these channels then we will certainly be relegated to that one channel in the future.

Make your contact on channels 38L and then move another channel.

Cheers

*Greetings!
*
*Thanks Doc,
*
*But one question that is still in my mind...
*
*It deals with elements and surface area available for ground.
*
*What occurs when there is not enough surface area to make the antenna
*resoant at 50 ohms?
****

Very few if any are ever resonat at 50 Ohms.

*Hint, 8 feet of ground surface, but trying to work a 9 foot antenna.
****

A nine foot vertical over a 8 foot diameter ground field (solid or mesh):

1) if it is a 1/4 lambda will have a radiation impedance of 36.5 + j24.5 Ohms. Now this will occur only at a very narrow set of frequencies. About 10 or 20 Hetrz. Essentially one frequency.

2) As frequency is decreased from that point the real part will change some. The the reactive part wil vary far greater. The imaginary part will actually reduce in value with respect to a tangent function. In fact at some point the imaginary part will reach zero. This is due to the fact that as a frequency goes up the physical length is now less than 1/4 lambda. As frequency keeps goping up the imaginary part will cross zero and become negative. This is where the antenna now has a capaictive component.

3) Now if we were to start at the frequency where the antenna is a 1/4 lambda and go up in frequency the imaginary part again will follow a tangent curve and become ever increasingly more inductive.

4) Now this is only covers the radiation resistance of the antenna. You have now introduced a ground plane. What you have failed to mention is where is the ground plane relative to the physical Earth. This is important. I would need to know that to help determine where the image of the antenna will be located. Since a 1/4 lambda antenna is not a complete antenna, it must have and image located in the ground relative to the hiegth above the surface of the Earth. These are essential in calculating ground losses. Ground losses are necessary to add tothe calculatoin as they effect the efficeincy of the overall system.

5) Also one other thought on radiation resistance. Since the 8 foot ground plane is not quite 1/4 wave length at the operating frequency, the ideal 36.5 = j24.5 Ohms is not quite the starting radiation resistance. It is though a close starting point.

6) Now if we let this antenna alone a tried to feed it with 50 Ohm coax what is our SWR? The magnitude of the impedance is roughly 44 Ohms. That will gives us a close match since 44 is very close to 50. But that does not satisfy the equation for SWR. To calculate SWR we first must know the load reflection coefficient. We can do that because we know the load impedance and the characteristic impedacne of the coax. Form the valules given we obtain a reflection coefficient of -.323 at angle of 85.6 degrees. For SWR we are only interested in the magnitude of the reflection coefficient, .323. The negative sign is not needed for SWR calculation as it tells us the phase of the reflected wave. Now SWR is found by:

S = 1 + .323 / 1 - .323 or about 1.95 for a load impedance of 36.5 + j24.5.

Now if the frequency were altered such that the imaginary part of the antenna were zero we get reflection coefficients of .156 and a SWR of 1.36. This will be the lowest we can achieve with this example.

Now one more note of importance. Since we have not accounted for grounds affect on the radiation impedance, this is only but an estimate of SWR. In reality the SWR can be vary greatly depending on ground. Unless you measure ground conductivity, the efects of grouond are dificult to estimate. computers are best suited for estimating ground effects. Even if ground effects were known the same proceedure above will be used.

7) Now how do I get the SWR at the transmitter to see 1 or 1:1? Well we can adjust the length of the coax until the SWR read 1:1. Yes that will work. But remember SWR is 1 + RC over 1 - RC, where RC is the reflection coefficient. The reflection coefficient is the difference over the sum of the characteristic impedance and th eload impedance. Now by adjusting the coax length have we changed any of the two? NO. Thus SWR on the line still remains constant. Now there a unique principal that allows the impedance looking into a coax to vary versus length. This impedance also varies with respect to a tangential curve. One thing about this principal is the load must remain constant for all lengths tried and the characteristic impedance of the line must remain constant. With that we can adjust the length until we get the desired impedance we want looking into th coax with some load on the other end. If we adjust the length until the impedance looking into the coax is 50 Ohms, and place a SWR meter at that point we would get the desired results. Again this has done notyhing tothe characteristic impedance of the line or the afffected the impedance of the load. The SWR on th eline is still the same. ALl we have done is changed the impedance looking into the coax to make the transmitter thinks it sees an matched condition.

Now why is this abad method to obtain a match? The load will vary greatly with ground variations, with frequency and with any surroundings that change. You have now added three variables that will affect the load impedance. Any combination of these will either change the load slowly or rapidly. Generally the later is the case. Now that length of coax is no longer valid because instead of one variable changing, frequency, we have added two others. Thus the

impedance seen looking into our coax no longer satisfies our matching problem.

Added some form of matching network at the base of the antenna to raise the resistive portion up to 50 Ohms is more preferred. ALso one other feature of the matching network used is that the reactive components can be tuned out so that the antennna will appear resitive. How this is done is best left for another time. Again depending on the quality of the matching network components, the SWR bandwidth can remain more usable.

This is very long winded but you asked for it. You wanted an explanation.

I think it is beddy bye time?

50 + j0 is the same as 50 Ohm pure resistance. By that definition there is but
only one solution. Yes there can be an infinite solution to give a magnitude of
50 Ohms but only one solution that yields a pure resistance.

*
*>Oh, OK. I found out where you got this equation and, as I suspected,
*>you are using it out of context. Furthermore, it is the MAGNITUDE of
*>the impedance -- not the impedance -- EXACTLY AS I SAID. It does not
*>fully specify the impedance.
*
*And the equation Z = R ? jX does not specify magnitude until you make
*the term 'j' a real number. And how do you do that? Square it. What is
*the equation you end up with? Z = (R2 + X2)^?. That is how you get a
*'real' value of impedance. Even the ARRL isn't confusing about this.
****

You never change the "j" term into a real number. All you have done is stated
the magnitude of the impedance. With each magnitude of the impedance there is a
corresponding angle. Thus that completes the exponential form of the impedance.
All you have done is started to change the trigonometric form to exponential.
You hve left off theta. Yes the real portion is easier to see in exponetial
form. To calculate SWR and the reflection coeficient you need the whole
impedance not just the magnitude.

****
*>I have to admit, however, the ARRL Handbook is confusing. What it
*>correctly calls magnitude here, it incorrectly calls impedance in the
*>subsequent section. That is the source of your confusion. Blame the
*>ARRL.
*
*So you are saying that _you_ are correct, but all the wisdom and
*experience of the engineers at the ARRL amounts to squat? Just what
*are your qualifications?
*
*Polar notation does not give you a real value. That is what
*rectangular notation is for, because rectangular notation is the
*application of the Pythagorean Theorem to polar notation, i.e. angles,
*i.e. planar coordinates, i.e. VECTORS. You read, but you do not
*understand what you are reading. That is why it is confusing to you.
*The ARRL isn't wrong, you are.
*
*Check this out:
*
*(22.362 + j44.722)^? = 50 ohms
*(732 - j02)^? = 73 ohms

*
*The resonant antenna is mismatched and the reactive, non-resonant
*antenna is matched. Now look at a different example in polar form:
*
*Zsource = 37 + j15 ohms
*Zload = 37 - j15 ohms
****

these look like trig form to me.

****
*Is that an impedance match? Yes. Will it reflect power? No. Is the
*load resonant? No.
****

For circuits it is a conjugate match. Works great lasts a long time. But for antennae you have left out one item. The characteristic impedacne of the coax. Where does that come into your scenario. Have you forgotten that? Matching an antenna to the coax the real portion of the antenna must match the characteristic impedance of the coax.

****
*This means that the only way to eliminate standing waves is to
*properly match the antenna to the coax/source. Then, and only then, do
*you not need to worry about the length of the coax (except to make it
*as short as possible), which is what I have held all along.
*
*And you omitted the rest of my post.
*
*Sparky, FLRC
****

To properly match everything you have a two step approach. You must match the source to the coax and the load to the coax. In this scenario the coax becomes a very nice low loss conduit for the RF wave to travel down with no reflections to obstruct them.

> antennas were 50 ohms.

Who claimed that? Not me. You aren't putting incorrect words in my
mouth again, are you?

I said for a 1:1 SWR (for a 50 ohm system like the overwhelming majority
of CBs), the load must be 50 ohms. Furthermore, if it is 50 ohms, it is
resonant. I showed that.

> I challenged him to come up with a single antenna that was 50 ohms with
> out some type of matching. Heck I have matched rain gutters with a gamma
> match.
>
> Fred W4JLE

And I responded to the challenge but you already forgot. Did you never
see a 1:1 SWR without a matching network? I have seen many.
Every ground plane is not 37 ohms and every dipole is not 73 ohms.
These are the resistances for the theoretical infinitely thin antenna.

I challenged you to show how you can, as you claim, match a 37 ohm load
by changing the length of your 50 ohm coax. I'm STILL waiting. You
cannot answer the question and will not concede that you are wrong.

*
*I guess you couldn't read the relevant question: What is a vector?
*
*>Do you believe an impedance of 22.36 + j44.72 ohms will yield a 1:1 SWR?
*
*Yes. "Show me where I'm wrong. Bzzzt. You can't do it", because you
*would be changing one of the fundamental principles of electronics
*that has existed for decades.
****

22.36 + j44.72 yields a magnitude of the reflection coefficient of about .61.

P = [(22.36 + j44.72) - (50 + j0)]/[22.36 + j44.72) + (50 + j0)]

believe me this yields about .61

Now we calculate SWR.

S = (1 + .61) / (1 - .61)
= 1.61/.39
= 4.13

I dare say that will yield a 1:1 SWR. 4.13:1 yes.

Do I win the challenge?

james

****
*>> An antenna is a load, just like any other load with reactance and/or
*>> resistance. There is no electromagnetic property that makes an antenna
*>> any different than any other reactance or resistance, because they all
*>> have both to some extent.
*>
*>OK.
*
*Therefore, it doesn't matter if your load is a non-reactive resistor
*or a resonant antenna, or even a non-resonant antenna: if the

*impedance is the same, you will get the same SWR. Hence, a
*non-resonant 50 ohm resistor provides a 1:1 match, and satisfies your
*$100 challenge.
****

Is non-reactive resistance the same as purely resistive impedance?
Yes a 50 Ohm resistor will yield a SWR of 1:1 with 50 Ohm coax. For an antenna to yield a SWR of 1:1 the whole impedance must be transformed up to 50 + j0. You can't just disregard the imaginary part of the impedance. Correct is does not radiate any power, but it is part of the impedance that can not be ignored.

****
*>> That wasn't what I said. You can have an infinite number of values for
*>> any LCR network that is resonant at a given frequency. THAT is what I
*>> said.
*>
*>OK. And when you find the impedance of that resonant circuit, what
*>is the imaginary component? That is, what is the number multiplied
*>by j?
*
*Zero. Have I said anything else? No.
*
*>By the way, that is not what you said. You said the "effective
*>impedance of a resonant circuit can be _any_ value."
*
*It is no different except in construction.
*
*>You were talking circuit impedance; not L and C and R components.
*>The circuit impedance would be the sum of the L and C and R impedances.
*
*That's what a resonant circuit is made of, you dope! The impedance of
*an ac circuit is found by the equation I gave earlier, where R is the
*net resistance and X is the net reactance. This is called "rectangular
*notation", it is a vector quantity, and it works the same way it has
*worked since it was first contrived. Maybe your hangup is that you
*haven't considered that an LCR circuit can be operated outside of
*resonance. It will then have reactance, regardless of the fact that it
*is resonant at another frequency. Even within the circuit's bandwidth
*there will be reactance when not on it's center frequency.
****

What you gave earlier is just the magnitude of the impedance. That is only half of the impedance. What about theta = invtan(X/R)? just hoping it goes away?

****
*I might add that this is why the SWR changes along the bandwidth.
*
*>To be resonant, there is only one value of the imaginary component of
*>this impedance; it must be zero.
*
*No problem.

*
*>> Let me paraphrase for myself: "A 1:1 SWR _can_ be achieved with only a
*>> resistive component . . ." Don't substitute my words for yours.
*>
*>Hold on. You left something out. You ALSO said "which does not contain
*>any capacitive or inductive reactance." This is equivalent to saying
*>that the imaginary component of the impedance MUST be zero -- exactly
*>what you get with resonance.
*
*Ok. I'll rewrite this for a fourth-grade reading level: A 1:1 SWR can
*be achieved with just a resistor. It can also be achieved with a
*combination of resistance and reactance, or even just reactance. The
*resistor has no (practical) capacitive or inductive reactance.
*Therefore, the resistor is not resonant. I have satisfied the
*requirements of your challenge.
****

gee 0 + j50 is pure reactance. Let's see what the magnitude is? Yep the square root of 50 squared is 50. But I thought that only real power can be radiated by real components. Since the impedance is imaginary the power radiated is reactive power. Reactive power is radiated as heat if I remember correctly. If you want a coffee warmer i guess a 50 Ohm reactive load will do the job.

Would you like to do the experiment I did in my RF lab? You ought to measure a carbon composition resistor at about 2 Ghz. If you have 1/2 inch leads you maybe lucky to get within +/- 30% on +/- 5% part.

****
*>So, in essense, you said a 1:1 SWR can only be achieved with a resonant
*>circuit.
*
*There you go sticking words where they don't belong. I never said,
*"can _only_ be achieved". You added words again.
*
*> Remember, we are talking about antennas.
*
*We are talking about the load at the end of a transmission line.
*
*> Do you think the
*>antenna behaves exactly like a resistor?
*
*No. And that wasn't your question.
*
*> If I increase (or decrease)
*>the frequency, will the impedance stay at 50 ohms?
*
*In an LCR circuit, no. In a purely resistive circuit, yes. That's the
*difference between an antenna and a resistor. Duh . . .
*
*>> >Example #2 was inaccurate. Your definition of impedance is wrong.
*>>

*>> It is the same definition that has been used for over a hundred years.
*>> Did you change that, too?
*>
*>No. You are calculating the magnitude of the impedance. This in NOT

> what is our SWR? The magnitude of the impedance is roughly 44 Ohms.

The magnitude of the impedance does not determine SWR.
The impedance determines SWR.

> That will gives us a close match since 44 is very close to 50.

Is 1.95:1 (as you calculate below) a "very close" match?
You have just demonstrated the problem with attempting to use
the magnitude of the impedance to estimate the match.

> But that does not satisfy the equation for SWR.

Yes, so why did you use it to estimate a very close match?

> To calculate SWR we first must know the load reflection coefficient.

Now you're cookin'.

Why measure ground conductivity? Just measure the damn SWR and you'll
know what it is! You must be a government employee.

> 7) Now how do I get the SWR at the transmitter to see 1 or 1:1? Well we
> can adjust the length of the coax until the SWR read 1:1. Yes that will
> work.

NOT! That will not work.
Go back and recalculate your reflection coefficient using a different
length of transmission line. What's that you say? The line length
was not part of the calculation? That's right!
The SWR is independent of the line length.

> But remember SWR is 1 + RC over 1 - RC, where RC is the reflection
> coefficient. The reflection coefficient is the difference over the sum
> of the characteristic impedance and th eload impedance. Now by adjusting

> coax to vary versus length.

I don't know that I'd call it "unique" but yes.

> This impedance also varies with respect to a tangential curve.

Say what?

> One thing about this principal is the load must remain constant for all
> lengths tried and the characteristic impedance of the line must remain
> constant. With that we can adjust the length until we get the desired
> impedance we want looking into th coax with some load on the other end.

Well, you are only going to get certain impedances and none of them will
be the desired 50 ohms.

> If we adjust the length until the impedance looking into the coax is
> 50 Ohms,

Can't be done.

> and place a SWR meter at that point we would get the desired results.

Since varying the length NEVER achieves a 50 ohm input impedance, you
will NEVER get the desired results.

> Again this has done notyhing tothe characteristic impedance of the line
> or the affected the impedance of the load.

Yeah, but it has violated the rules of physics.

Consider this: the SWR measurement is, in essence, a measure of the
reflected power (just assume for the moment that forward power is
relatively constant). The impedance seen at the input to the
transmission line is related to that reflected power. The phase
of the reflected power changes with transmission line length but
the magnitude (power) does not.

The ONLY way you will see 50 ohms at the input to the transmission
line is if there is no reflected power. Since there is reflected
power coming back down the coax from the antenna, there is NO length
of coax that will prevent it from showing up at the radio. You will
NEVER see 50 ohms at the coax input when there is reflected power
at the antenna. It simply cannot happen.

> The SWR on th eline is still the same. ALl we have done is changed the
> impedance looking into the coax to make the transmitter thinks it sees
> an matched condition.

No it doesn't.

> Now why is this abad method to obtain a match?

Because it doesn't work.

Don't make mine all noisy. It's hard enough to talk to my skip buddies
as it is with all the damn Mexicans and AM'ers with their cheap AM only
radios that the carrier frequency changes when they modulate.

*<anylength@willdo.com> wrote:
*
*>Oh, OK. I found out where you got this equation and, as I suspected,
*>you are using it out of context. Furthermore, it is the MAGNITUDE of
*>the impedance -- not the impedance -- EXACTLY AS I SAID. It does not
*>fully specify the impedance.
*
*And the equation Z = R ? jX does not specify magnitude until you make
*the term 'j' a real number. And how do you do that? Square it. What is
*the equation you end up with? Z = (R2 + X2)^?. That is how you get a
*'real' value of impedance. Even the ARRL isn't confusing about this.
****

By equating "Z" with the algebraic equality used in your first equation, you have defined "Z" as a complex quantity. The form of the impedance now in the trigonometric form. Your second equation, Z = (R2 + X2)^?, merely describes the magnitude of that impedance. This equation has only done part of the transformation of the impedance to it's exponential form. The inverse tangent of the reactance divided by the resistance will yield the angle. Now the exponential form is complete. Now in this form the real portion is easy to see. It is simply the coefficient of the exponential equation of e raised to the j theta power. Oh my gosh where did that dang "j" come from? I thought we got rid of it? Not hardly. This is taught early in any good EE curriculum. Now we can change that dang "jtheta" term into an angle and low and behold we have the more familiar polar form. Boy did my networks prof hate the term "polar".

****
*>I have to admit, however, the ARRL Handbook is confusing. What it
*>correctly calls magnitude here, it incorrectly calls impedance in the
*>subsequent section. That is the source of your confusion. Blame the
*>ARRL.
*
*So you are saying that _you_ are correct, but all the wisdom and
*experience of the engineers at the ARRL amounts to squat? Just what
*are your qualifications?
*
*Polar notation does not give you a real value. That is what
*rectangular notation is for, because rectangular notation is the
*application of the Pythagorean Theorem to polar notation, i.e. angles,
*i.e. planar coordinates, i.e. VECTORS. You read, but you do not
*understand what you are reading. That is why it is confusing to you.
*The ARRL isn't wrong, you are.

****

geee I thought retangular(trigonometeric) form and polar(exponential) form all pointed to the same spot on the plane? Did I miss something? I thought a vector quantity was direction and magnitude. When did angular coordinates become a vector?
Sorry when you plot an impedance on a Smith Chart you are not plotting a vector quantity. You are plotting a point on a coordiante system. You can express that point by refering it inrelations to two axis or by an angle and distance. That does not quantify as a vector.

****
*Check this out:
*
*(22.362 + j44.722)^? = 50 ohms
*(732 - j02)^? = 73 ohms
*
****

Nice magnitudes but where's the angle?????????????

****
*The resonant antenna is mismatched and the reactive, non-resonant
*antenna is matched. Now look at a different example in polar form:
*
*Zsource = 37 + j15 ohms
*Zload = 37 - j15 ohms
*
*Is that an impedance match? Yes. Will it reflect power? No. Is the
*load resonant? No.
****

Again I reitterate, a nice conjugate match. good for matching a rf amp. Useless for matching an antenna to the coax. Oh buy the way, the load is resonant. Show me where the net reactance of a parallel RC and a parallel RL in parallel containing reactive components of -j15 and +j15 is not zero. Does that not define resonance?

****
*This means that the only way to eliminate standing waves is to
*properly match the antenna to the coax/source. Then, and only then, do
*you not need to worry about the length of the coax (except to make it
*as short as possible), which is what I have held all along.
*
*And you omitted the rest of my post.
*
*Sparky, FLRC
****

When antennae and transmission lines are involved you must match the source (transmitter) to the characteristic impedance of the transmission line. The same hold for the load(antenna). I believe the ARRL Antenna book has two chapters

dedicated to this. Remember what the term characteristic impedance means. The key word is "characteristic". A transmission line is a two port network that has terminal impedances defined by the characteristic impedance. You can model a transmission line as a two block with the input and output defined as impedances of pure resistance as dictated by the value of the charcateristic impedance. Thus the transmitter matches to the input port and the antenna present the required termination impedance. The main diference form circuital two port analysis there is no conjugate match necessary. By definition a transmission line is considered match if the device attached to it's ports are the same as the characteristic impedance of the transmision line. Since impedance must be real, the load and source can not be purely reactive. In reality there is no antenna that is purely resistive for all frequencies. Thus it is desirable to have some matching network at the feed of the antenna. Likewise, the output stage of the transmitter is seldom 50 Ohms. So there is some matching network in the transmitter to transform it's impedance to 50 Ohms. By 50 Ohms I define that as 50 + j0 Ohms.

>A crime is crime according to many here. So if they can kick in your door
>for any perceived violation why would that exclude radio violations?

Because an officer walking down the street can't see the interference you are causing to your neighbor's television set so he can't "perceive" the violation, unless he has been invited into the neighbor's house to witness the TVI (not that they are going to waste their time doing that). Even that, that is not enough probable cause because without proper test equipment, he couldn't determine if the interference is coming from you... of course, under this law, as it has been stated time and time again, that would be enough for him to knock on your door and ask to inspect your station - and that topic has been covered so much, it's pretty much buried.

3360. Re: Coax Question

Newsgroup: rec.radio.cb
Date: 2000-12-21 07:17:29 UTC
From: Bill Nelson <billn@spock.peak.org>
Message-ID: <91saq9$ri8$3@bashir.peak.org>
Source record: 64694

Someone, maybe Sparky, posted a URL where he claimed that it supported his contention that coax length affected the SWR. The url is: http://people.delphi.com/CecilMoore/mystery.htm

If you go to the url and read the whole thing, you will find that no such claim is made. I have communicated with Cecil, and know that he knows far too much transmission line theory to make such a claim.

The ladder line is being used as a matching section. No one has claimed that tuned lengths of ladder line cannot be used as impedance matching devices.

Further, the SWR on the ladder line is NOT 1:1. The 1:1 impedance is on the coax that is connected to the ladder line matching section.

For example, going by Cecil's chart, the minimum SWR possible on the coax is not 1:1 unless the SWR on the ladder line is 9:1. To get a 2:1 SWR minimum on the coax, the SWR on the ladder line can be either 4.5:1 or 18:1.

This follows transmission line theory exactly, as I have pointed out before. Just because you can get a good match on your coax, does not mean that the matching section (in this case the ladder line) will have a low SWR.

In the chart given, if the SWR on the ladder line is 1:1, the SWR on the coax is 9:1. Notice the similarity to the coax 1:1 case? This is also exactly as transmission line theory would predict.

Also note that Cecil is using a 1:1 choke at the ladder line to coax connection. This is necessary to stop the high rf currents that would otherwise flow on the outside of the coax. He could have used a balun, but this treatment is just as good, and arguably easier to implement in an outdoor environment.

Further support follows a bit later, when he provides a chart and discussion called "Optimum Length For A Matching Section". He states in the discussion that this matching section is the ladder line.

There is no discussion of coax length, as this is immaterial. Cecil is well aware of the fact that changing the length of the 50 ohm coax will NOT affect the SWR.

Hopefully, this will end this discussion, once and for all.

Fred, I am not making any excuses, just simply pointing out that there are CBer that don't agree with the law and will continue with operations. I am a father of four kids and will instill in them to use there own common sense when making decisions in life. If that includes breaking silly laws then so be it, but he will also know that there is a consequence if caught breaking those laws. With all do respect, we would not enjoy religious, racial, political, social,or any other kind of freedom If we didn't have strong willed people challenging the system. I for one will not be dictated, I am a free thinker and will continue with a sound power of reason.
